(54) Title: **HUMAN GENES AND GENE EXPRESSION PRODUCTS**

(57) Abstract: This invention relates to novel human polynucleotides and variants thereof, their encoded polypeptides and variants thereof, to genes corresponding to these polynucleotides and to proteins expressed by the genes. The invention also relates to diagnostic and therapeutic agents employing such novel human polynucleotides, their corresponding genes or gene products, e.g., these genes and proteins, including probes, antisense constructs, and antibodies.

HUMAN GENES AND GENE EXPRESSION PRODUCTS

Cross-Reference to Related Application

[0001] This application claims the benefit of earlier-filed U.S. provisional application serial no. 60/226,326 filed August 16, 2000, which application is incorporated herein by reference in its entirety.

Field of the Invention

[0002] The present invention relates to polynucleotides of human origin, particularly in human colon, breast, prostate, and/or lung tissue, and the encoded gene products.

Background of the Invention

[0003] Identification of novel polynucleotides, particularly those that encode an expressed gene product, is important in the advancement of drug discovery, diagnostic technologies, and the understanding of the progression and nature of complex diseases such as cancer. Identification of genes expressed in different cell types isolated from sources that differ in disease state or stage, developmental stage, exposure to various environmental factors, the tissue of origin, the species from which the tissue was isolated, and the like is key to identifying the genetic factors that are responsible for the phenotypes associated with these various differences.

[0004] This invention provides novel human polynucleotides, the polypeptides encoded by these polynucleotides, and the genes and proteins corresponding to these novel polynucleotides.

Summary of the Invention

[0005] This invention relates to novel human polynucleotides and variants thereof, their encoded polypeptides and variants thereof, to genes corresponding to these polynucleotides and to proteins expressed by the genes. The invention also relates to diagnostics and therapeutics comprising such novel human polynucleotides, their corresponding genes or gene products, including probes, antisense nucleotides, and antibodies. The polynucleotides of the invention correspond to a polynucleotide comprising the sequence information of at least one of SEQ ID NOS:1-6010.

[0006] Various aspects and embodiments of the invention will be readily apparent to the ordinarily skilled artisan upon reading the description provided herein.

Detailed Description of the Invention

[0007] Before the present invention is described, it is to be understood that this invention is not limited to particular embodiments described, as such may, of course, vary. It is also to be understood that the terminology used herein is for the purpose of describing particular embodiments only, and is not intended to be limiting.

Unless defined otherwise, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. Although any methods and materials similar or equivalent to those described herein can be used in the practice or testing of the present invention, the preferred methods and materials are now described.

5 All publications and patent applications cited in this specification are herein incorporated by reference as if each individual publication or patent application were specifically and individually indicated to be incorporated by reference. The citation of any publication is for its disclosure prior to the filing date and should not be construed as an admission that the present invention is not entitled to antedate such publication by virtue of prior invention.

10 It must be noted that as used herein and in the appended claims, the singular forms "a," "and," and "the" include plural referents unless the context clearly dictates otherwise. Thus, for example, reference to "a polynucleotide" includes a plurality of such polynucleotides and reference to "the colon cancer cell" includes reference to one or more cells and equivalents thereof known to those skilled in the art, and so forth.

15 The publications and applications discussed herein are provided solely for their disclosure prior to the filing date of the present application. Nothing herein is to be construed as an admission that the present invention is not entitled to antedate such publication by virtue of prior invention. Further, the dates of publication provided may be different from the actual publication dates which may need to be independently confirmed.

20 Definitions

The terms "polynucleotide" and "nucleic acid," used interchangeably herein, refer to a polymeric forms of nucleotides of any length, either ribonucleotides or deoxynucleotides. Thus, these terms include, but are not limited to, single-, double-, or multi-stranded DNA or RNA, genomic DNA, cDNA, DNA-RNA hybrids, branched nucleic acid (see, e.g., U.S. Pat. Nos. 5,124,246; 5,710,264; and
25 5,849,481), or a polymer comprising purine and pyrimidine bases or other natural, chemically or biochemically modified, non-natural, or derivatized nucleotide bases. These terms further include, but are not limited to, mRNA or cDNA that comprise intronic sequences (see, e.g., Niwa et al. (1999) Cell 99(7):691-702). The backbone of the polynucleotide can comprise sugars and phosphate groups (as may typically be found in RNA or DNA), or modified or substituted sugar or phosphate groups.

30 Alternatively, the backbone of the polynucleotide can comprise a polymer of synthetic subunits such as phosphoramidites and thus can be an oligodeoxynucleoside phosphoramidate or a mixed phosphoramidate-phosphodiester oligomer. Peyrottes et al. (1996) Nucl. Acids Res. 24:1841-1848; Chaturvedi et al. (1996) Nucl. Acids Res. 24:2318-2323. A polynucleotide may comprise modified nucleotides, such as methylated nucleotides and nucleotide analogs, uracyl, other sugars, and linking

groups such as fluororibose and thioate, and nucleotide branches. The sequence of nucleotides may be interrupted by non-nucleotide components. A polynucleotide may be further modified after polymerization, such as by conjugation with a labeling component. Other types of modifications included in this definition are caps, substitution of one or more of the naturally occurring nucleotides with an analog, and introduction of means for attaching the polynucleotide to proteins, metal ions, labeling components, other polynucleotides, or a solid support.

The terms "polypeptide" and "protein," used interchangeably herein, refer to a polymeric form of amino acids of any length, which can include coded and non-coded amino acids, chemically or biochemically modified or derivatized amino acids, and polypeptides having modified peptide backbones. The term includes fusion proteins, including, but not limited to, fusion proteins with a heterologous amino acid sequence, fusions with heterologous and homologous leader sequences, with or without N-terminal methionine residues; immunologically tagged proteins; and the like.

"Diagnosis" as used herein generally includes determination of a subject's susceptibility to a disease or disorder, determination as to whether a subject is presently affected by a disease or disorder, prognosis of a subject affected by a disease or disorder (e.g., identification of pre-metastatic or metastatic cancerous states, stages of cancer, or responsiveness of cancer to therapy), and therametrics (e.g., monitoring a subject's condition to provide information as to the effect or efficacy of therapy).

"Sample" or "biological sample" as used herein encompasses a variety of sample types, and are generally meant to refer to samples of biological fluids or tissues, particularly samples obtained from tissues, especially from cells of the type associated with a disease or condition for which a diagnostic application is designed (e.g., ductal adenocarcinoma), and the like. "Sample" or "biological sample" are meant to encompass blood and other liquid samples of biological origin, solid tissue samples, such as a biopsy specimen or tissue cultures or cells derived therefrom and the progeny thereof. These terms encompass samples that have been manipulated in any way after their procurement as well as derivatives and fractions of samples, where the samples may be manipulated by, for example, treatment with reagents, solubilization, or enrichment for certain components. The terms also encompass clinical samples, and also includes cells in cell culture, cell supernatants, cell lysates, serum, plasma, biological fluids, and tissue samples. Where the sample is solid tissue, the cells of the tissue can be dissociated or tissue sections can be analyzed.

The terms "treatment," "treating," "treat" and the like are used herein to generally refer to obtaining a desired pharmacologic and/or physiologic effect. The effect may be prophylactic in terms of completely or partially preventing a disease or symptom thereof and/or may be therapeutic in terms of a partial or complete stabilization or cure for a disease and/or adverse effect attributable to the disease. "Treatment" as used herein covers any treatment of a disease in a mammal, particularly a

human, and includes: (a) preventing the disease or symptom from occurring in a subject which may be predisposed to the disease or symptom but has not yet been diagnosed as having it; (b) inhibiting the disease symptom, i.e., arresting its development; or relieving the disease symptom, i.e., causing regression of the disease or symptom.

5 The terms "individual," "subject," "host," and "patient," used interchangeably herein and refer to any mammalian subject for whom diagnosis, treatment, or therapy is desired, particularly humans. Other subjects may include cattle, dogs, cats, guinea pigs, rabbits, rats, mice, horses, and so on.

As used herein the term "isolated" refers to a polynucleotide, a polypeptide, an antibody, or a host cell that is in an environment different from that in which the polynucleotide, the polypeptide, the
10 antibody, or the host cell naturally occurs. A polynucleotide, a polypeptide, an antibody, or a host cell which is isolated is generally substantially purified. As used herein, the term "substantially purified" refers to a compound (e.g., either a polynucleotide or a polypeptide or an antibody) that is removed from its natural environment and is at least 60% free, preferably 75% free, and most preferably 90% free from other components with which it is naturally associated. Thus, for example, a composition
15 containing A is "substantially free of" B when at least 85% by weight of the total A+B in the composition is A. Preferably, A comprises at least about 90% by weight of the total of A+B in the composition, more preferably at least about 95% or even 99% by weight.

A "host cell," as used herein, refers to a microorganism or a eukaryotic cell or cell line cultured as a unicellular entity which can be, or has been, used as a recipient for a recombinant vector or other
20 transfer polynucleotides, and include the progeny of the original cell which has been transfected. It is understood that the progeny of a single cell may not necessarily be completely identical in morphology or in genomic or total DNA complement as the original parent, due to natural, accidental, or deliberate mutation.

The terms "cancer," "neoplasm," "tumor," and "carcinoma," are used interchangeably herein to
25 refer to cells which exhibit relatively autonomous growth, so that they exhibit an aberrant growth phenotype characterized by a significant loss of control of cell proliferation. In general, cells of interest for detection or treatment in the present application include precancerous (e.g., benign), malignant, metastatic, and non-metastatic cells. Detection of cancerous cell is of particular interest.

The use of "e", as in 10e-3, indicates that the number to the left of "e" is raised to the power of
30 the number to the right of "e" (thus, 10e-3 is 10⁻³).

The term "heterologous" as used herein in the context of, for example, heterologous nucleic acid or amino acid sequences, heterologous polypeptides, or heterologous nucleic acid, is meant to refer to material that originates from a source different from that with which it is joined or associated. For example, two DNA sequences are heterologous to one another if the sequences are from different genes

or from different species. A recombinant host cell containing a sequence that is heterologous to the host cell can be, for example, a bacterial cell containing a sequence encoding a human polypeptide.

The invention relates to polynucleotides comprising the disclosed nucleotide sequences, to full length cDNA, mRNA, genomic sequences, and genes corresponding to these sequences and degenerate variants thereof, and to polypeptides encoded by the polynucleotides of the invention and polypeptide variants. The following detailed description describes the polynucleotide compositions encompassed by the invention, methods for obtaining cDNA or genomic DNA encoding a full-length gene product, expression of these polynucleotides and genes, identification of structural motifs of the polynucleotides and genes, identification of the function of a gene product encoded by a gene corresponding to a polynucleotide of the invention, use of the provided polynucleotides as probes and in mapping and in tissue profiling, use of the corresponding polypeptides and other gene products to raise antibodies, and use of the polynucleotides and their encoded gene products for therapeutic and diagnostic purposes.

Polynucleotide Compositions

The scope of the invention with respect to polynucleotide compositions includes, but is not necessarily limited to, polynucleotides having a sequence set forth in any one of SEQ ID NOS:1-6010; polynucleotides obtained from the biological materials described herein or other biological sources (particularly human sources) by hybridization under stringent conditions (particularly conditions of high stringency); genes corresponding to the provided polynucleotides; variants of the provided polynucleotides and their corresponding genes, particularly those variants that retain a biological activity of the encoded gene product (*e.g.*, a biological activity ascribed to a gene product corresponding to the provided polynucleotides as a result of the assignment of the gene product to a protein family(ies) and/or identification of a functional domain present in the gene product). Other nucleic acid compositions contemplated by and within the scope of the present invention will be readily apparent to one of ordinary skill in the art when provided with the disclosure here. "Polynucleotide" and "nucleic acid" as used herein with reference to nucleic acids of the composition is not intended to be limiting as to the length or structure of the nucleic acid unless specifically indicated.

The invention features polynucleotides that are expressed in human tissue, especially human colon, prostate, breast, lung and/or endothelial tissue. Novel nucleic acid compositions of the invention of particular interest comprise a sequence set forth in any one of SEQ ID NOS:1-6010 or an identifying sequence thereof. An "identifying sequence" is a contiguous sequence of residues at least about 10 nt to about 20 nt in length, usually at least about 50 nt to about 100 nt in length, that uniquely identifies a polynucleotide sequence, *e.g.*, exhibits less than 90%, usually less than about 80% to about 85% sequence identity to any contiguous nucleotide sequence of more than about 20 nt. Thus, the

subject novel nucleic acid compositions include full length cDNAs or mRNAs that encompass an identifying sequence of contiguous nucleotides from any one of SEQ ID NOS: 1-6010.

The polynucleotides of the invention also include polynucleotides having sequence similarity or sequence identity. Nucleic acids having sequence similarity are detected by hybridization under low stringency conditions, for example, at 50°C and 10XSSC (0.9 M saline/0.09 M sodium citrate) and remain bound when subjected to washing at 55°C in 1XSSC. Sequence identity can be determined by hybridization under stringent conditions, for example, at 50°C or higher and 0.1XSSC (9 mM saline/0.9 mM sodium citrate). Hybridization methods and conditions are well known in the art, see, *e.g.*, USPN 5,707,829. Nucleic acids that are substantially identical to the provided polynucleotide sequences, *e.g.* allelic variants, genetically altered versions of the gene, *etc.*, bind to the provided polynucleotide sequences (SEQ ID NOS:1-6010) under stringent hybridization conditions. By using probes, particularly labeled probes of DNA sequences, one can isolate homologous or related genes. The source of homologous genes can be any species, *e.g.* primate species, particularly human; rodents, such as rats and mice; canines, felines, bovines, ovines, equines, yeast, nematodes, *etc.*

Preferably, hybridization is performed using at least 15 contiguous nucleotides (nt) of at least one of SEQ ID NOS:1-6010. That is, when at least 15 contiguous nt of one of the disclosed SEQ ID NOS. is used as a probe, the probe will preferentially hybridize with a nucleic acid comprising the complementary sequence, allowing the identification and retrieval of the nucleic acids that uniquely hybridize to the selected probe. Probes from more than one SEQ ID NO. can hybridize with the same nucleic acid if the cDNA from which they were derived corresponds to one mRNA. Probes of more than 15 nt can be used, *e.g.*, probes of from about 18 nt to about 100 nt, but 15 nt represents sufficient sequence for unique identification.

The polynucleotides of the invention also include naturally occurring variants of the nucleotide sequences (*e.g.*, degenerate variants, allelic variants, *etc.*). Variants of the polynucleotides of the invention are identified by hybridization of putative variants with nucleotide sequences disclosed herein, preferably by hybridization under stringent conditions. For example, by using appropriate wash conditions, variants of the polynucleotides of the invention can be identified where the allelic variant exhibits at most about 25-30% base pair (bp) mismatches relative to the selected polynucleotide probe. In general, allelic variants contain 15-25% bp mismatches, and can contain as little as even 5-15%, or 2-5%, or 1-2% bp mismatches, as well as a single bp mismatch.

The invention also encompasses homologs corresponding to the polynucleotides of SEQ ID NOS:1-6010, where the source of homologous genes can be any mammalian species, *e.g.*, primate species, particularly human; rodents, such as rats; canines, felines, bovines, ovines, equines, yeast, nematodes, *etc.* Between mammalian species, *e.g.*, human and mouse, homologs generally have

substantial sequence similarity, *e.g.*, at least 75% sequence identity, usually at least 90%, more usually at least 95% between nucleotide sequences. Sequence similarity is calculated based on a reference sequence, which may be a subset of a larger sequence, such as a conserved motif, coding region, flanking region, *etc.* A reference sequence will usually be at least about 18 contiguous nt long, more
5 usually at least about 30 nt long, and may extend to the complete sequence that is being compared. Algorithms for sequence analysis are known in the art, such as gapped BLAST, described in Altschul, et al. *Nucleic Acids Res.* (1997) 25:3389-3402.

In general, variants of the invention have a sequence identity greater than at least about 65%, preferably at least about 75%, more preferably at least about 85%, and can be greater than at least
10 about 90% or more as determined by the Smith-Waterman homology search algorithm as implemented in MPSRCH program (Oxford Molecular). For the purposes of this invention, a preferred method of calculating percent identity is the Smith-Waterman algorithm, using the following. Global DNA sequence identity must be greater than 65% as determined by the Smith-Waterman homology search algorithm as implemented in MPSRCH program (Oxford Molecular) using an affine gap search with
15 the following search parameters: gap open penalty, 12; and gap extension penalty, 1.

The subject nucleic acids can be cDNAs or genomic DNAs, as well as fragments thereof, particularly fragments that encode a biologically active gene product and/or are useful in the methods disclosed herein (*e.g.*, in diagnosis, as a unique identifier of a differentially expressed gene of interest, *etc.*). The term "cDNA" as used herein is intended to include all nucleic acids that share the
20 arrangement of sequence elements found in native mature mRNA species, where sequence elements are exons and 3' and 5' non-coding regions. Normally mRNA species have contiguous exons, with the intervening introns, when present, being removed by nuclear RNA splicing, to create a continuous open reading frame encoding a polypeptide of the invention.

A genomic sequence of interest comprises the nucleic acid present between the initiation codon
25 and the stop codon, as defined in the listed sequences, including all of the introns that are normally present in a native chromosome. It can further include the 3' and 5' untranslated regions found in the mature mRNA. It can further include specific transcriptional and translational regulatory sequences, such as promoters, enhancers, *etc.*, including about 1 kb, but possibly more, of flanking genomic DNA at either the 5' and 3' end of the transcribed region. The genomic DNA can be isolated as a fragment
30 of 100 kbp or smaller; and substantially free of flanking chromosomal sequence. The genomic DNA flanking the coding region, either 3' and 5', or internal regulatory sequences as sometimes found in introns, contains sequences required for proper tissue, stage-specific, or disease-state specific expression.

The nucleic acid compositions of the subject invention can encode all or a part of the subject polypeptides. Double or single stranded fragments can be obtained from the DNA sequence by chemically synthesizing oligonucleotides in accordance with conventional methods, by restriction enzyme digestion, by PCR amplification, *etc.* Isolated polynucleotides and polynucleotide fragments of the invention comprise at least about 10, about 15, about 20, about 35, about 50, about 100, about 150 to about 200, about 250 to about 300, or about 350 contiguous nt selected from the polynucleotide sequences as shown in SEQ ID NOS:1-6010. For the most part, fragments will be of at least 15 nt, usually at least 18 nt or 25 nt, and up to at least about 50 contiguous nt in length or more. In a preferred embodiment, the polynucleotide molecules comprise a contiguous sequence of at least 12 nt selected from the group consisting of the polynucleotides shown in SEQ ID NOS:1-6010.

Probes specific to the polynucleotides of the invention can be generated using the polynucleotide sequences disclosed in SEQ ID NOS:1-6010. The probes are preferably at least about 12, 15, 16, 18, 20, 22, 24, or 25 nt fragment of a corresponding contiguous sequence of SEQ ID NOS:1-6010, and can be less than 2, 1, 0.5, 0.1, or 0.05 kb in length. The probes can be synthesized chemically or can be generated from longer polynucleotides using restriction enzymes. The probes can be labeled, for example, with a radioactive, biotinylated, or fluorescent tag. Preferably, probes are designed based upon an identifying sequence of a polynucleotide of one of SEQ ID NOS:1-6010. More preferably, probes are designed based on a contiguous sequence of one of the subject polynucleotides that remain unmasked following application of a masking program for masking low complexity (*e.g.*, XBLAST) to the sequence, *i.e.*, one would select an unmasked region, as indicated by the polynucleotides outside the poly-n stretches of the masked sequence produced by the masking program.

The polynucleotides of the subject invention are isolated and obtained in substantial purity, generally as other than an intact chromosome. Usually, the polynucleotides, either as DNA or RNA, will be obtained substantially free of other naturally-occurring nucleic acid sequences, generally being at least about 50%, usually at least about 90% pure and are typically "recombinant," *e.g.*, flanked by one or more nucleotides with which it is not normally associated on a naturally occurring chromosome.

The polynucleotides of the invention can be provided as a linear molecule or within a circular molecule, and can be provided within autonomously replicating molecules (vectors) or within molecules without replication sequences. Expression of the polynucleotides can be regulated by their own or by other regulatory sequences known in the art. The polynucleotides of the invention can be introduced into suitable host cells using a variety of techniques available in the art, such as transferrin polycation-mediated DNA transfer, transfection with naked or encapsulated nucleic acids, liposome-

mediated DNA transfer, intracellular transportation of DNA-coated latex beads, protoplast fusion, viral infection, electroporation, gene gun, calcium phosphate-mediated transfection, and the like.

The subject nucleic acid compositions can be used to, for example, produce polypeptides, as probes for the detection of mRNA of the invention in biological samples (e.g., extracts of human cells) to generate additional copies of the polynucleotides, to generate ribozymes or antisense oligonucleotides, and as single stranded DNA probes or as triple-strand forming oligonucleotides. The probes described herein can be used to, for example, determine the presence or absence of the polynucleotide sequences as shown in SEQ ID NOS:1-6010 or variants thereof in a sample. These and other uses are described in more detail below.

10 Use of Polynucleotides to Obtain Full-Length cDNA, Gene, and Promoter Region

In one embodiment, the polynucleotides are useful as starting materials to construct larger molecules. In one example, the polynucleotides of the invention are used to construct polynucleotides that encode a larger polypeptide (e.g., up to the full-length native polypeptide as well as fusion proteins comprising all or a portion of the native polypeptide) or may be used to produce haptens of the polypeptide (e.g., polypeptides useful to generate antibodies).

In one particular example, the polynucleotides of the invention are used to make or isolate cDNA molecules encoding all or portion of a naturally-occurring polypeptide. Full-length cDNA molecules comprising the disclosed polynucleotides are obtained as follows. A polynucleotide having a sequence of one of SEQ ID NOS:1-6010, or a portion thereof comprising at least 12, 15, 18, or 20 nt, is used as a hybridization probe to detect hybridizing members of a cDNA library using probe design methods, cloning methods, and clone selection techniques such as those described in USPN 5,654,173. Libraries of cDNA are made from selected tissues, such as normal or tumor tissue, or from tissues of a mammal treated with, for example, a pharmaceutical agent. Preferably, the tissue is the same as the tissue from which the polynucleotides of the invention were isolated, as both the polynucleotides described herein and the cDNA represent expressed genes. Most preferably, the cDNA library is made from the biological material described herein in the Examples. The choice of cell type for library construction can be made after the identity of the protein encoded by the gene corresponding to the polynucleotide of the invention is known. This will indicate which tissue and cell types are likely to express the related gene, and thus represent a suitable source for the mRNA for generating the cDNA. Where the provided polynucleotides are isolated from cDNA libraries, the libraries are prepared from mRNA of human colon cells, more preferably, human colon cancer cells, even more preferably, from a highly metastatic colon cell, Km12L4-A.

Techniques for producing and probing nucleic acid sequence libraries are described, for example, in Sambrook et al., Molecular Cloning: A Laboratory Manual, 2nd Ed., (1989) Cold Spring

Harbor Press, Cold Spring Harbor, NY. The cDNA can be prepared by using primers based on polynucleotides comprising a sequence of SEQ ID NOS:1-6010. In one embodiment, the cDNA library can be made from only poly-adenylated mRNA. Thus, poly-T primers can be used to prepare cDNA from the mRNA.

5 Members of the library that are larger than the provided polynucleotides, and preferably that encompass the complete coding sequence of the native message, are obtained. In order to confirm that the entire cDNA has been obtained, RNA protection experiments are performed as follows. Hybridization of a full-length cDNA to an mRNA will protect the RNA from RNase degradation. If the cDNA is not full length, then the portions of the mRNA that are not hybridized will be subject to
10 RNase degradation. This is assayed, as is known in the art, by changes in electrophoretic mobility on polyacrylamide gels, or by detection of released monoribonucleotides. Sambrook et al., *Molecular Cloning: A Laboratory Manual*, 2nd Ed., (1989) Cold Spring Harbor Press, Cold Spring Harbor, NY. In order to obtain additional sequences 5' to the end of a partial cDNA, 5' RACE (PCR Protocols: A Guide to Methods and Applications, (1990) Academic Press, Inc.) can be performed.

15 Genomic DNA is isolated using the provided polynucleotides in a manner similar to the isolation of full-length cDNAs. Briefly, the provided polynucleotides, or portions thereof, are used as probes to libraries of genomic DNA. Preferably, the library is obtained from the cell type that was used to generate the polynucleotides of the invention, but this is not essential. Most preferably, the genomic DNA is obtained from the biological material described herein in the Examples. Such
20 libraries can be in vectors suitable for carrying large segments of a genome, such as P1 or YAC, as described in detail in Sambrook et al., *supra*, 9.4-9.30. In addition, genomic sequences can be isolated from human BAC libraries, which are commercially available from Research Genetics, Inc., Huntsville, Alabama, USA, for example. In order to obtain additional 5' or 3' sequences, chromosome walking is performed, as described in Sambrook et al., such that adjacent and overlapping fragments of genomic
25 DNA are isolated. These are mapped and pieced together, as is known in the art, using restriction digestion enzymes and DNA ligase.

 Using the polynucleotide sequences of the invention, corresponding full-length genes can be isolated using both classical and PCR methods to construct and probe cDNA libraries. Using either method, Northern blots, preferably, are performed on a number of cell types to determine which cell
30 lines express the gene of interest at the highest level. Classical methods of constructing cDNA libraries are taught in Sambrook et al., *supra*. With these methods, cDNA can be produced from mRNA and inserted into viral or expression vectors. Typically, libraries of mRNA comprising poly(A) tails can be produced with poly(T) primers. Similarly, cDNA libraries can be produced using the instant sequences as primers.

PCR methods are used to amplify the members of a cDNA library that comprise the desired insert. In this case, the desired insert will contain sequence from the full length cDNA that corresponds to the instant polynucleotides. Such PCR methods include gene trapping and RACE methods. Gene trapping entails inserting a member of a cDNA library into a vector. The vector then is denatured to produce single stranded molecules. Next, a substrate-bound probe, such as a biotinylated oligo, is used to trap cDNA inserts of interest. Biotinylated probes can be linked to an avidin-bound solid substrate. PCR methods can be used to amplify the trapped cDNA. To trap sequences corresponding to the full length genes, the labeled probe sequence is based on the polynucleotide sequences of the invention. Random primers or primers specific to the library vector can be used to amplify the trapped cDNA. Such gene trapping techniques are described in Gruber et al., WO 95/04745 and Gruber et al., USPN 5,500,356. Kits are commercially available to perform gene trapping experiments from, for example, Life Technologies, Gaithersburg, Maryland, USA.

"Rapid amplification of cDNA ends," or RACE, is a PCR method of amplifying cDNAs from a number of different RNAs. The cDNAs are ligated to an oligonucleotide linker, and amplified by PCR using two primers. One primer is based on sequence from the instant polynucleotides, for which full length sequence is desired, and a second primer comprises sequence that hybridizes to the oligonucleotide linker to amplify the cDNA. A description of this method is reported in WO 97/19110. In preferred embodiments of RACE, a common primer is designed to anneal to an arbitrary adaptor sequence ligated to cDNA ends (Apte and Siebert, *Biotechniques* (1993) 15:890-893; Edwards et al., *Nuc. Acids Res.* (1991) 19:5227-5232). When a single gene-specific RACE primer is paired with the common primer, preferential amplification of sequences between the single gene specific primer and the common primer occurs. Commercial cDNA pools modified for use in RACE are available.

Another PCR-based method generates full-length cDNA library with anchored ends without needing specific knowledge of the cDNA sequence. The method uses lock-docking primers (I-VI), where one primer, poly TV (I-III) locks over the polyA tail of eukaryotic mRNA producing first strand synthesis and a second primer, polyGH (IV-VI) locks onto the polyC tail added by terminal deoxynucleotidyl transferase (TdT)(see, e.g., WO 96/40998).

The promoter region of a gene generally is located 5' to the initiation site for RNA polymerase II. Hundreds of promoter regions contain the "TATA" box, a sequence such as TATTA or TATAA, which is sensitive to mutations. The promoter region can be obtained by performing 5' RACE using a primer from the coding region of the gene. Alternatively, the cDNA can be used as a probe for the genomic sequence, and the region 5' to the coding region is identified by "walking up." If the gene is

highly expressed or differentially expressed, the promoter from the gene can be of use in a regulatory construct for a heterologous gene.

Once the full-length cDNA or gene is obtained, DNA encoding variants can be prepared by site-directed mutagenesis, described in detail in Sambrook et al., 15.3-15.63. The choice of codon or nucleotide to be replaced can be based on disclosure herein on optional changes in amino acids to achieve altered protein structure and/or function.

As an alternative method to obtaining DNA or RNA from a biological material, nucleic acid comprising nucleotides having the sequence of one or more polynucleotides of the invention can be synthesized. Thus, the invention encompasses nucleic acid molecules ranging in length from 15 nt (corresponding to at least 15 contiguous nt of one of SEQ ID NOS:1-6010) up to a maximum length suitable for one or more biological manipulations, including replication and expression, of the nucleic acid molecule. The invention includes but is not limited to (a) nucleic acid having the size of a full gene, and comprising at least one of SEQ ID NOS:1-6010; (b) the nucleic acid of (a) also comprising at least one additional gene, operably linked to permit expression of a fusion protein; (c) an expression vector comprising (a) or (b); (d) a plasmid comprising (a) or (b); and (e) a recombinant viral particle comprising (a) or (b). Once provided with the polynucleotides disclosed herein, construction or preparation of (a) - (e) are well within the skill in the art.

The sequence of a nucleic acid comprising at least 15 contiguous nt of at least any one of SEQ ID NOS:1-6010, preferably the entire sequence of at least any one of SEQ ID NOS:1-6010, is not limited and can be any sequence of A, T, G, and/or C (for DNA) and A, U, G, and/or C (for RNA) or modified bases thereof, including inosine and pseudouridine. The choice of sequence will depend on the desired function and can be dictated by coding regions desired, the intron-like regions desired, and the regulatory regions desired. Where the entire sequence of any one of SEQ ID NOS:1-6010 is within the nucleic acid, the nucleic acid obtained is referred to herein as a polynucleotide comprising the sequence of any one of SEQ ID NOS:1-6010.

Expression of Polypeptide Encoded by Full-Length cDNA or Full-Length Gene

The provided polynucleotides (e.g., a polynucleotide having a sequence of one of SEQ ID NOS:1-6010), the corresponding cDNA, or the full-length gene is used to express a partial or complete gene product. Constructs of polynucleotides having sequences of SEQ ID NOS:1-6010 can also be generated synthetically. Alternatively, single-step assembly of a gene and entire plasmid from large numbers of oligodeoxyribonucleotides is described by, e.g., Stemmer et al., Gene (Amsterdam) (1995) 164(1):49-53. In this method, assembly PCR (the synthesis of long DNA sequences from large numbers of oligodeoxyribonucleotides (oligos)) is described. The method is derived from DNA

shuffling (Stemmer, Nature (1994) 370:389-391), and does not rely on DNA ligase, but instead relies on DNA polymerase to build increasingly longer DNA fragments during the assembly process.

Appropriate polynucleotide constructs are purified using standard recombinant DNA techniques as described in, for example, Sambrook *et al.*, *Molecular Cloning: A Laboratory Manual*, 2nd Ed., (1989) Cold Spring Harbor Press, Cold Spring Harbor, NY, and under current regulations described in United States Dept. of HHS, National Institute of Health (NIH) Guidelines for Recombinant DNA Research. The gene product encoded by a polynucleotide of the invention is expressed in any expression system, including, for example, bacterial, yeast, insect, amphibian and mammalian systems. Vectors, host cells and methods for obtaining expression in same are well known in the art. Suitable vectors and host cells are described in USPN 5,654,173.

Polynucleotide molecules comprising a polynucleotide sequence provided herein are generally propagated by placing the molecule in a vector. Viral and non-viral vectors are used, including plasmids. The choice of plasmid will depend on the type of cell in which propagation is desired and the purpose of propagation. Certain vectors are useful for amplifying and making large amounts of the desired DNA sequence. Other vectors are suitable for expression in cells in culture. Still other vectors are suitable for transfer and expression in cells in a whole animal or person. The choice of appropriate vector is well within the skill of the art. Many such vectors are available commercially. Methods for preparation of vectors comprising a desired sequence are well known in the art.

The polynucleotides set forth in SEQ ID NOS:1-6010 or their corresponding full-length polynucleotides are linked to regulatory sequences as appropriate to obtain the desired expression properties. These can include promoters (attached either at the 5' end of the sense strand or at the 3' end of the antisense strand), enhancers, terminators, operators, repressors, and inducers. The promoters can be regulated or constitutive. In some situations it may be desirable to use conditionally active promoters, such as tissue-specific or developmental stage-specific promoters. These are linked to the desired nucleotide sequence using the techniques described above for linkage to vectors. Any techniques known in the art can be used.

When any of the above host cells, or other appropriate host cells or organisms, are used to replicate and/or express the polynucleotides or nucleic acids of the invention, the resulting replicated nucleic acid, RNA, expressed protein or polypeptide, is within the scope of the invention as a product of the host cell or organism. The product is recovered by any appropriate means known in the art.

Once the gene corresponding to a selected polynucleotide is identified, its expression can be regulated in the cell to which the gene is native. For example, an endogenous gene of a cell can be regulated by an exogenous regulatory sequence as disclosed in USPN 5,641,670.

Identification of Functional and Structural Motifs

Translations of the nucleotide sequence of the provided polynucleotides, cDNAs or full genes can be aligned with individual known sequences. Similarity with individual sequences can be used to determine the activity of the polypeptides encoded by the polynucleotides of the invention. Also,
5 sequences exhibiting similarity with more than one individual sequence can exhibit activities that are characteristic of either or both individual sequences.

The full length sequences and fragments of the polynucleotide sequences of the nearest neighbors can be used as probes and primers to identify and isolate the full length sequence corresponding to provided polynucleotides. The nearest neighbors can indicate a tissue or cell type to
10 be used to construct a library for the full-length sequences corresponding to the provided polynucleotides.

Typically, a selected polynucleotide is translated in all six frames to determine the best alignment with the individual sequences. The sequences disclosed herein in the Sequence Listing are in a 5' to 3' orientation and translation in three frames can be sufficient (with a few specific exceptions as
15 described in the Examples). These amino acid sequences are referred to, generally, as query sequences, which will be aligned with the individual sequences. Databases with individual sequences are described in "Computer Methods for Macromolecular Sequence Analysis" *Methods in Enzymology* (1996) 266, Doolittle, Academic Press, Inc., a division of Harcourt Brace & Co., San Diego, California, USA. Databases include GenBank, EMBL, and DNA Database of Japan (DDBJ).

20 Query and individual sequences can be aligned using the methods and computer programs described above, and include BLAST 2.0, available over the world wide web at a site supported by the National Center for Biotechnology Information, which is supported by the National Library of Medicine and the National Institutes of Health. See also Altschul, et al. *Nucleic Acids Res.* (1997) 25:3389-3402. Another alignment algorithm is Fasta, available in the Genetics Computing Group
25 (GCG) package, Madison, Wisconsin, USA, a wholly owned subsidiary of Oxford Molecular Group, Inc. Other techniques for alignment are described in Doolittle, supra. Preferably, an alignment program that permits gaps in the sequence is utilized to align the sequences. The Smith-Waterman is one type of algorithm that permits gaps in sequence alignments. See *Meth. Mol. Biol.* (1997) 70: 173-187. Also, the GAP program using the Needleman and Wunsch alignment method can be utilized to
30 align sequences. An alternative search strategy uses MPSRCH software, which runs on a MASPAR computer. MPSRCH uses a Smith-Waterman algorithm to score sequences on a massively parallel computer. This approach improves ability to identify sequences that are distantly related matches, and is especially tolerant of small gaps and nucleotide sequence errors. Amino acid sequences encoded by the provided polynucleotides can be used to search both protein and DNA databases. Incorporated

herein by reference are all sequences that have been made public as of the filing date of this application by any of the DNA or protein sequence databases, including the patent databases (*e.g.*, GeneSeq).

Also incorporated by reference are those sequences that have been submitted to these databases as of the filing date of the present application but not made public until after the filing date of the present application.

Results of individual and query sequence alignments can be divided into three categories: high similarity, weak similarity, and no similarity. Individual alignment results ranging from high similarity to weak similarity provide a basis for determining polypeptide activity and/or structure. Parameters for categorizing individual results include: percentage of the alignment region length where the strongest alignment is found, percent sequence identity, and p value. The percentage of the alignment region length is calculated by counting the number of residues of the individual sequence found in the region of strongest alignment, *e.g.*, contiguous region of the individual sequence that contains the greatest number of residues that are identical to the residues of the corresponding region of the aligned query sequence. This number is divided by the total residue length of the query sequence to calculate a percentage. For example, a query sequence of 20 amino acid residues might be aligned with a 20 amino acid region of an individual sequence. The individual sequence might be identical to amino acid residues 5, 9-15, and 17-19 of the query sequence. The region of strongest alignment is thus the region stretching from residue 9-19, an 11 amino acid stretch. The percentage of the alignment region length is: 11 (length of the region of strongest alignment) divided by (query sequence length) 20 or 55%.

Percent sequence identity is calculated by counting the number of amino acid matches between the query and individual sequence and dividing total number of matches by the number of residues of the individual sequences found in the region of strongest alignment. Thus, the percent identity in the example above would be 10 matches divided by 11 amino acids, or approximately, 90.9%

P value is the probability that the alignment was produced by chance. For a single alignment, the p value can be calculated according to Karlin et al., Proc. Natl. Acad. Sci. (1990) 87:2264 and Karlin et al., Proc. Natl. Acad. Sci. (1993) 90. The p value of multiple alignments using the same query sequence can be calculated using an heuristic approach described in Altschul et al., Nat. Genet. (1994) 6:119. Alignment programs such as BLAST program can calculate the p value. See also Altschul et al., Nucleic Acids Res. (1997) 25:3389-3402.

Another factor to consider for determining identity or similarity is the location of the similarity or identity. Strong local alignment can indicate similarity even if the length of alignment is short. Sequence identity scattered throughout the length of the query sequence also can indicate a similarity between the query and profile sequences. The boundaries of the region where the sequences align can be determined according to Doolittle, *supra*; BLAST 2.0 (see, *e.g.*, Altschul, et al. Nucleic Acids Res.

(1997) 25:3389-3402) or FAST programs; or by determining the area where sequence identity is highest.

High Similarity. In general, in alignment results considered to be of high similarity, the percent of the alignment region length is typically at least about 55% of total length query sequence; more typically, at least about 58%; even more typically; at least about 60% of the total residue length of the query sequence. Usually, percent length of the alignment region can be as much as about 62%; more usually, as much as about 64%; even more usually, as much as about 66%. Further, for high similarity, the region of alignment, typically, exhibits at least about 75% of sequence identity; more typically, at least about 78%; even more typically; at least about 80% sequence identity. Usually, percent sequence identity can be as much as about 82%; more usually, as much as about 84%; even more usually, as much as about 86%.

The p value is used in conjunction with these methods. If high similarity is found, the query sequence is considered to have high similarity with a profile sequence when the p value is less than or equal to about $10e-2$; more usually; less than or equal to about $10e-3$; even more usually; less than or equal to about $10e-4$. More typically, the p value is no more than about $10e-5$; more typically; no more than or equal to about $10e-10$; even more typically, no more than or equal to about $10e-15$ for the query sequence to be considered high similarity.

Weak Similarity. In general, where alignment results considered to be of weak similarity, there is no minimum percent length of the alignment region nor minimum length of alignment. A better showing of weak similarity is considered when the region of alignment is, typically, at least about 15 amino acid residues in length; more typically, at least about 20; even more typically, at least about 25 amino acid residues in length. Usually, length of the alignment region can be as much as about 30 amino acid residues; more usually, as much as about 40; even more usually, as much as about 60 amino acid residues. Further, for weak similarity, the region of alignment, typically, exhibits at least about 35% of sequence identity; more typically, at least about 40%; even more typically, at least about 45% sequence identity. Usually, percent sequence identity can be as much as about 50%; more usually, as much as about 55%; even more usually, as much as about 60%.

If low similarity is found, the query sequence is considered to have weak similarity with a profile sequence when the p value is usually less than or equal to about $10e-2$; more usually, less than or equal to about $10e-3$; even more usually; less than or equal to about $10e-4$. More typically, the p value is no more than about $10e-5$; more usually; no more than or equal to about $10e-10$; even more usually, no more than or equal to about $10e-15$ for the query sequence to be considered weak similarity.

Similarity Determined by Sequence Identity Alone. Sequence identity alone can be used to determine similarity of a query sequence to an individual sequence and can indicate the activity of the

sequence. Such an alignment, preferably, permits gaps to align sequences. Typically, the query sequence is related to the profile sequence if the sequence identity over the entire query sequence is at least about 15%; more typically, at least about 20%; even more typically, at least about 25%; even more typically, at least about 50%. Sequence identity alone as a measure of similarity is most useful when the query sequence is usually, at least 80 residues in length; more usually, at least 90 residues in length; even more usually, at least 95 amino acid residues in length. More typically, similarity can be concluded based on sequence identity alone when the query sequence is preferably 100 residues in length; more preferably, 120 residues in length; even more preferably, 150 amino acid residues in length.

Alignments with Profile and Multiple Aligned Sequences. Translations of the provided polynucleotides can be aligned with amino acid profiles that define either protein families or common motifs. Also, translations of the provided polynucleotides can be aligned to multiple sequence alignments (MSA) comprising the polypeptide sequences of members of protein families or motifs. Similarity or identity with profile sequences or MSAs can be used to determine the activity of the gene products (e.g., polypeptides) encoded by the provided polynucleotides or corresponding cDNA or genes. For example, sequences that show an identity or similarity with a chemokine profile or MSA can exhibit chemokine activities.

Profiles can be designed manually by (1) creating an MSA, which is an alignment of the amino acid sequence of members that belong to the family and (2) constructing a statistical representation of the alignment. Such methods are described, for example, in Birney et al., Nucl. Acid Res. (1996) 24(14): 2730-2739. MSAs of some protein families and motifs are publicly available. For example, the Genome Sequencing Center at the Washington University School of Medicine provides a web set (Pfam) which provides MSAs of 547 different families and motifs. These MSAs are described also in Sonnhammer et al., Proteins (1997) 28: 405-420. Other sources over the world wide web include the site supported by the European Molecular Biology Laboratories in Heidelberg, Germany. A brief description of these MSAs is reported in Pascarella et al., Prot. Eng. (1996) 9(3):249-251. Techniques for building profiles from MSAs are described in Sonnhammer et al., supra; Birney et al., supra; and "Computer Methods for Macromolecular Sequence Analysis," Methods in Enzymology (1996) 266, Doolittle, Academic Press, Inc., San Diego, California, USA.

Similarity between a query sequence and a protein family or motif can be determined by (a) comparing the query sequence against the profile and/or (b) aligning the query sequence with the members of the family or motif. Typically, a program such as Searchwise is used to compare the query sequence to the statistical representation of the multiple alignment, also known as a profile (see Birney

et al., supra). Other techniques to compare the sequence and profile are described in Sonnhammer et al., supra and Doolittle, supra.

Next, methods described by Feng et al., J. Mol. Evol. (1987) 25:351 and Higgins et al., CABIOS (1989) 5:151 can be used align the query sequence with the members of a family or motif, also known as a MSA. Sequence alignments can be generated using any of a variety of software tools. Examples include PileUp, which creates a multiple sequence alignment, and is described in Feng et al., J. Mol. Evol. (1987) 25:351. Another method, GAP, uses the alignment method of Needleman et al., J. Mol. Biol. (1970) 48:443. GAP is best suited for global alignment of sequences. A third method, BestFit, functions by inserting gaps to maximize the number of matches using the local homology algorithm of Smith et al., Adv. Appl. Math. (1981) 2:482. In general, the following factors are used to determine if a similarity between a query sequence and a profile or MSA exists: (1) number of conserved residues found in the query sequence, (2) percentage of conserved residues found in the query sequence, (3) number of frameshifts, and (4) spacing between conserved residues.

Some alignment programs that both translate and align sequences can make any number of frameshifts when translating the nucleotide sequence to produce the best alignment. The fewer frameshifts needed to produce an alignment, the stronger the similarity or identity between the query and profile or MSAs. For example, a weak similarity resulting from no frameshifts can be a better indication of activity or structure of a query sequence, than a strong similarity resulting from two frameshifts. Preferably, three or fewer frameshifts are found in an alignment; more preferably two or fewer frameshifts; even more preferably, one or fewer frameshifts; even more preferably, no frameshifts are found in an alignment of query and profile or MSAs.

Conserved residues are those amino acids found at a particular position in all or some of the family or motif members. Alternatively, a position is considered conserved if only a certain class of amino acids is found in a particular position in all or some of the family members. For example, the N-terminal position can contain a positively charged amino acid, such as lysine, arginine, or histidine.

Typically, a residue of a polypeptide is conserved when a class of amino acids or a single amino acid is found at a particular position in at least about 40% of all class members; more typically, at least about 50%; even more typically, at least about 60% of the members. Usually, a residue is conserved when a class or single amino acid is found in at least about 70% of the members of a family or motif; more usually, at least about 80%; even more usually, at least about 90%; even more usually, at least about 95%.

A residue is considered conserved when three unrelated amino acids are found at a particular position in some or all of the members; more usually, two unrelated amino acids. These residues are conserved when the unrelated amino acids are found at particular positions in at least about 40% of all

class member; more typically, at least about 50%; even more typically, at least about 60% of the members. Usually, a residue is conserved when a class or single amino acid is found in at least about 70% of the members of a family or motif; more usually, at least about 80%; even more usually, at least about 90%; even more usually, at least about 95%.

5 A query sequence has similarity to a profile or MSA when the query sequence comprises at least about 25% of the conserved residues of the profile or MSA; more usually, at least about 30%; even more usually; at least about 40%. Typically, the query sequence has a stronger similarity to a profile sequence or MSA when the query sequence comprises at least about 45% of the conserved residues of the profile or MSA; more typically, at least about 50%; even more typically, at least about
10 55%.

Identification of Secreted & Membrane-Bound Polypeptides. Both secreted and membrane-bound polypeptides of the present invention are of particular interest. For example, levels of secreted polypeptides can be assayed in body fluids that are convenient, such as blood, plasma, serum, and other body fluids such as urine, prostatic fluid and semen. Membrane-bound polypeptides are useful for
15 constructing vaccine antigens or inducing an immune response. Such antigens would comprise all or part of the extracellular region of the membrane-bound polypeptides. Because both secreted and membrane-bound polypeptides comprise a fragment of contiguous hydrophobic amino acids, hydrophobicity predicting algorithms can be used to identify such polypeptides.

A signal sequence is usually encoded by both secreted and membrane-bound polypeptide genes
20 to direct a polypeptide to the surface of the cell. The signal sequence usually comprises a stretch of hydrophobic residues. Such signal sequences can fold into helical structures. Membrane-bound polypeptides typically comprise at least one transmembrane region that possesses a stretch of hydrophobic amino acids that can transverse the membrane. Some transmembrane regions also exhibit a helical structure. Hydrophobic fragments within a polypeptide can be identified by using computer
25 algorithms. Such algorithms include Hopp & Woods, Proc. Natl. Acad. Sci. USA (1981) 78:3824-3828; Kyte & Doolittle, J. Mol. Biol. (1982) 157: 105-132; and RAOAR algorithm, Degli Esposti et al., Eur. J. Biochem. (1990) 190: 207-219.

Another method of identifying secreted and membrane-bound polypeptides is to translate the polynucleotides of the invention in all six frames and determine if at least 8 contiguous hydrophobic
30 amino acids are present. Those translated polypeptides with at least 8; more typically, 10; even more typically, 12 contiguous hydrophobic amino acids are considered to be either a putative secreted or membrane bound polypeptide. Hydrophobic amino acids include alanine, glycine, histidine, isoleucine, leucine, lysine, methionine, phenylalanine, proline, threonine, tryptophan, tyrosine, and valine

Identification of the Function of an Expression Product of a Full-Length Gene

Ribozymes, antisense constructs, and dominant negative mutants can be used to determine function of the expression product of a gene corresponding to a polynucleotide provided herein. These methods and compositions are particularly useful where the provided novel polynucleotide exhibits no significant or substantial homology to a sequence encoding a gene of known function. Antisense molecules and ribozymes can be constructed from synthetic polynucleotides. Typically, the phosphoramidite method of oligonucleotide synthesis is used. See Beaucage et al., Tet. Lett. (1981) 22:1859 and USPN 4,668,777. Automated devices for synthesis are available to create oligonucleotides using this chemistry. Examples of such devices include Biosearch 8600, Models 392 and 394 by Applied Biosystems, a division of Perkin-Elmer Corp., Foster City, California, USA; and Expedite by Perceptive Biosystems, Framingham, Massachusetts, USA. Synthetic RNA, phosphate analog oligonucleotides, and chemically derivatized oligonucleotides can also be produced, and can be covalently attached to other molecules. RNA oligonucleotides can be synthesized, for example, using RNA phosphoramidites. This method can be performed on an automated synthesizer, such as Applied Biosystems, Models 392 and 394, Foster City, California, USA.

Phosphorothioate oligonucleotides can also be synthesized for antisense construction. A sulfurizing reagent, such as tetraethylthiuram disulfide (TETD) in acetonitrile can be used to convert the internucleotide cyanoethyl phosphite to the phosphorothioate triester within 15 minutes at room temperature. TETD replaces the iodine reagent, while all other reagents used for standard phosphoramidite chemistry remain the same. Such a synthesis method can be automated using Models 392 and 394 by Applied Biosystems, for example.

Oligonucleotides of up to 200 nt can be synthesized, more typically, 100 nt; more typically 50 nt; even more typically, 30 to 40 nt. These synthetic fragments can be annealed and ligated together to construct larger fragments. See, for example, Sambrook et al., supra. Trans-cleaving catalytic RNAs (ribozymes) are RNA molecules possessing endoribonuclease activity. Ribozymes are specifically designed for a particular target, and the target message must contain a specific nucleotide sequence. They are engineered to cleave any RNA species site-specifically in the background of cellular RNA. The cleavage event renders the mRNA unstable and prevents protein expression. Importantly, ribozymes can be used to inhibit expression of a gene of unknown function for the purpose of determining its function in an in vitro or in vivo context, by detecting the phenotypic effect. One commonly used ribozyme motif is the hammerhead, for which the substrate sequence requirements are minimal. Design of the hammerhead ribozyme, as well as therapeutic uses of ribozymes, are disclosed in Usman et al., Current Opin. Struct. Biol. (1996) 6:527. Methods for production of ribozymes,

including hairpin structure ribozyme fragments, methods of increasing ribozyme specificity, and the like are known in the art.

The hybridizing region of the ribozyme can be modified or can be prepared as a branched structure as described in Horn and Urdea, *Nucleic Acids Res.* (1989) 17:6959. The basic structure of the ribozymes can also be chemically altered in ways familiar to those skilled in the art, and chemically synthesized ribozymes can be administered as synthetic oligonucleotide derivatives modified by monomeric units. In a therapeutic context, liposome mediated delivery of ribozymes improves cellular uptake, as described in Birikh et al., *Eur. J. Biochem.* (1997) 245:1.

Antisense nucleic acids are designed to specifically bind to RNA, resulting in the formation of RNA-DNA or RNA-RNA hybrids, with an arrest of DNA replication, reverse transcription or messenger RNA translation. Antisense polynucleotides based on a selected polynucleotide sequence can interfere with expression of the corresponding gene. Antisense polynucleotides are typically generated within the cell by expression from antisense constructs that contain the antisense strand as the transcribed strand. Antisense polynucleotides based on the disclosed polynucleotides will bind and/or interfere with the translation of mRNA comprising a sequence complementary to the antisense polynucleotide. The expression products of control cells and cells treated with the antisense construct are compared to detect the protein product of the gene corresponding to the polynucleotide upon which the antisense construct is based. The protein is isolated and identified using routine biochemical methods.

Given the extensive background literature and clinical experience in antisense therapy, one skilled in the art can use selected polynucleotides of the invention as additional potential therapeutics. The choice of polynucleotide can be narrowed by first testing them for binding to "hot spot" regions of the genome of cancerous cells. If a polynucleotide is identified as binding to a "hot spot," testing the polynucleotide as an antisense compound in the corresponding cancer cells is warranted.

As an alternative method for identifying function of the gene corresponding to a polynucleotide disclosed herein, dominant negative mutations are readily generated for corresponding proteins that are active as homomultimers. A mutant polypeptide will interact with wild-type polypeptides (made from the other allele) and form a non-functional multimer. Thus, a mutation is in a substrate-binding domain, a catalytic domain, or a cellular localization domain. Preferably, the mutant polypeptide will be overproduced. Point mutations are made that have such an effect. In addition, fusion of different polypeptides of various lengths to the terminus of a protein can yield dominant negative mutants. General strategies are available for making dominant negative mutants (see, e.g., Herskowitz, *Nature* (1987) 329:219). Such techniques can be used to create loss of function mutations, which are useful for determining protein function.

Polypeptides and Variants Thereof

The polypeptides of the invention include those encoded by the disclosed polynucleotides, as well as nucleic acids that, by virtue of the degeneracy of the genetic code, are not identical in sequence to the disclosed polynucleotides. Thus, the invention includes within its scope a polypeptide encoded
5 by a polynucleotide having the sequence of any one of SEQ ID NOS:1-6010 or a variant thereof.

In general, the term "polypeptide" as used herein refers to both the full length polypeptide encoded by the recited polynucleotide, the polypeptide encoded by the gene represented by the recited polynucleotide, as well as portions or fragments thereof. "Polypeptides" also includes variants of the naturally occurring proteins, where such variants are homologous or substantially similar to the
10 naturally occurring protein, and can be of an origin of the same or different species as the naturally occurring protein (e.g., human, murine, or some other species that naturally expresses the recited polypeptide, usually a mammalian species). In general, variant polypeptides have a sequence that has at least about 80%, usually at least about 90%, and more usually at least about 98% sequence identity with a differentially expressed polypeptide of the invention, as measured by BLAST 2.0 using the
15 parameters described above. The variant polypeptides can be naturally or non-naturally glycosylated, i.e., the polypeptide has a glycosylation pattern that differs from the glycosylation pattern found in the corresponding naturally occurring protein.

The invention also encompasses homologs of the disclosed polypeptides (or fragments thereof) where the homologs are isolated from other species, i.e. other animal or plant species, where such
20 homologs, usually mammalian species, e.g. rodents, such as mice, rats; domestic animals, e.g., horse, cow, dog, cat; and humans. By "homolog" is meant a polypeptide having at least about 35%, usually at least about 40% and more usually at least about 60% amino acid sequence identity to a particular differentially expressed protein as identified above, where sequence identity is determined using the BLAST 2.0 algorithm, with the parameters described supra.

In general, the polypeptides of the subject invention are provided in a non-naturally occurring environment, e.g. are separated from their naturally occurring environment. In certain embodiments, the subject protein is present in a composition that is enriched for the protein as compared to a control. As such, purified polypeptide is provided, where by purified is meant that the protein is present in a composition that is substantially free of non-differentially expressed polypeptides, where by
25 substantially free is meant that less than 90%, usually less than 60% and more usually less than 50% of the composition is made up of non-differentially expressed polypeptides.

Also within the scope of the invention are variants; variants of polypeptides include mutants, fragments, and fusions. Mutants can include amino acid substitutions, additions or deletions. The amino acid substitutions can be conservative amino acid substitutions or substitutions to eliminate non-

essential amino acids, such as to alter a glycosylation site, a phosphorylation site or an acetylation site, or to minimize misfolding by substitution or deletion of one or more cysteine residues that are not necessary for function. Conservative amino acid substitutions are those that preserve the general charge, hydrophobicity/ hydrophilicity, and/or steric bulk of the amino acid substituted. Variants can be designed so as to retain or have enhanced biological activity of a particular region of the protein (e.g., a functional domain and/or, where the polypeptide is a member of a protein family, a region associated with a consensus sequence). Selection of amino acid alterations for production of variants can be based upon the accessibility (interior vs. exterior) of the amino acid (see, e.g., Go et al, *Int. J. Peptide Protein Res.* (1980) 15:211), the thermostability of the variant polypeptide (see, e.g., Querol et al., *Prot. Eng.* (1996) 9:265), desired glycosylation sites (see, e.g., Olsen and Thomsen, *J. Gen. Microbiol.* (1991) 137:579), desired disulfide bridges (see, e.g., Clarke et al., *Biochemistry* (1993) 32:4322; and Wakarchuk et al., *Protein Eng.* (1994) 7:1379), desired metal binding sites (see, e.g., Toma et al., *Biochemistry* (1991) 30:97, and Haezrebrouck et al., *Protein Eng.* (1993) 6:643), and desired substitutions within proline loops (see, e.g., Masul et al., *Appl. Env. Microbiol.* (1994) 60:3579). Cysteine-depleted muteins can be produced as disclosed in USPN 4,959,314.

Variants also include fragments of the polypeptides disclosed herein, particularly haptens, biologically active fragments, and/or fragments corresponding to functional domains. Fragments of interest will typically be at least about 10 aa to at least about 15 aa in length, usually at least about 50 aa in length, and can be as long as 300 aa in length or longer, but will usually not exceed about 1000 aa in length, where the fragment will have a stretch of amino acids that is identical to a polypeptide encoded by a polynucleotide having a sequence of any SEQ ID NOS:1-6010, or a homolog thereof. The protein variants described herein are encoded by polynucleotides that are within the scope of the invention. The genetic code can be used to select the appropriate codons to construct the corresponding variants.

25 Computer-Related Embodiments

In general, a library of polynucleotides is a collection of sequence information, which information is provided in either biochemical form (e.g., as a collection of polynucleotide molecules), or in electronic form (e.g., as a collection of polynucleotide sequences stored in a computer-readable form, as in a computer system and/or as part of a computer program). The sequence information of the polynucleotides can be used in a variety of ways, e.g., as a resource for gene discovery, as a representation of sequences expressed in a selected cell type (e.g., cell type markers), and/or as markers of a given disease or disease state. In general, a disease marker is a representation of a gene product that is present in all cells affected by disease either at an increased or decreased level relative to a normal cell (e.g., a cell of the same or similar type that is not substantially affected by disease). For

example, a polynucleotide sequence in a library can be a polynucleotide that represents an mRNA, polypeptide, or other gene product encoded by the polynucleotide, that is either overexpressed or underexpressed in a breast ductal cell affected by cancer relative to a normal (i.e., substantially disease-free) breast cell.

5 The nucleotide sequence information of the library can be embodied in any suitable form, e.g., electronic or biochemical forms. For example, a library of sequence information embodied in electronic form comprises an accessible computer data file (or, in biochemical form, a collection of nucleic acid molecules) that contains the representative nucleotide sequences of genes that are differentially expressed (e.g., overexpressed or underexpressed) as between, for example, i) a
10 cancerous cell and a normal cell; ii) a cancerous cell and a dysplastic cell; iii) a cancerous cell and a cell affected by a disease or condition other than cancer; iv) a metastatic cancerous cell and a normal cell and/or non-metastatic cancerous cell; v) a malignant cancerous cell and a non-malignant cancerous cell (or a normal cell) and/or vi) a dysplastic cell relative to a normal cell. Other combinations and comparisons of cells affected by various diseases or stages of disease will be readily apparent to the
15 ordinarily skilled artisan. Biochemical embodiments of the library include a collection of nucleic acids that have the sequences of the genes in the library, where the nucleic acids can correspond to the entire gene in the library or to a fragment thereof, as described in greater detail below.

 The polynucleotide libraries of the subject invention generally comprise sequence information of a plurality of polynucleotide sequences, where at least one of the polynucleotides has a sequence of
20 any of SEQ ID NOS:1-6010. By plurality is meant at least 2, usually at least 3 and can include up to all of SEQ ID NOS:1-6010. The length and number of polynucleotides in the library will vary with the nature of the library, e.g., if the library is an oligonucleotide array, a cDNA array, a computer database of the sequence information, etc.

 Where the library is an electronic library, the nucleic acid sequence information can be present
25 in a variety of media. "Media" refers to a manufacture, other than an isolated nucleic acid molecule, that contains the sequence information of the present invention. Such a manufacture provides the genome sequence or a subset thereof in a form that can be examined by means not directly applicable to the sequence as it exists in a nucleic acid. For example, the nucleotide sequence of the present invention, e.g. the nucleic acid sequences of any of the polynucleotides of SEQ ID NOS:1-6010, can
30 be recorded on computer readable media, e.g. any medium that can be read and accessed directly by a computer. Such media include, but are not limited to: magnetic storage media, such as a floppy disc, a hard disc storage medium, and a magnetic tape; optical storage media such as CD-ROM; electrical storage media such as RAM and ROM; and hybrids of these categories such as magnetic/optical storage media. One of skill in the art can readily appreciate how any of the presently known computer

readable mediums can be used to create a manufacture comprising a recording of the present sequence information. "Recorded" refers to a process for storing information on computer readable medium, using any such methods as known in the art. Any convenient data storage structure can be chosen, based on the means used to access the stored information. A variety of data processor programs and
5 formats can be used for storage, e.g. word processing text file, database format, etc. In addition to the sequence information, electronic versions of the libraries of the invention can be provided in conjunction or connection with other computer-readable information and/or other types of computer-readable files (e.g., searchable files, executable files, etc, including, but not limited to, for example, search program software, etc.).

10 By providing the nucleotide sequence in computer readable form, the information can be accessed for a variety of purposes. Computer software to access sequence information is publicly available. For example, the gapped BLAST (Altschul et al. Nucleic Acids Res. (1997) 25:3389-3402) and BLAZE (Brutlag et al. Comp. Chem. (1993) 17:203) search algorithms on a Sybase system can be used to identify open reading frames (ORFs) within the genome that contain homology to ORFs from
15 other organisms.

As used herein, "a computer-based system" refers to the hardware means, software means, and data storage means used to analyze the nucleotide sequence information of the present invention. The minimum hardware of the computer-based systems of the present invention comprises a central processing unit (CPU), input means, output means, and data storage means. A skilled artisan can
20 readily appreciate that any one of the currently available computer-based system are suitable for use in the present invention. The data storage means can comprise any manufacture comprising a recording of the present sequence information as described above, or a memory access means that can access such a manufacture.

"Search means" refers to one or more programs implemented on the computer-based system,
25 to compare a target sequence or target structural motif, or expression levels of a polynucleotide in a sample, with the stored sequence information. Search means can be used to identify fragments or regions of the genome that match a particular target sequence or target motif. A variety of known algorithms are publicly known and commercially available, e.g. MacPattern (EMBL), BLASTN and BLASTX (NCBI). A "target sequence" can be any polynucleotide or amino acid sequence of six or
30 more contiguous nucleotides or two or more amino acids, preferably from about 10 to 100 amino acids or from about 30 to 300 nt. A variety of comparing means can be used to accomplish comparison of sequence information from a sample (e.g., to analyze target sequences, target motifs, or relative expression levels) with the data storage means. A skilled artisan can readily recognize that any one of the publicly available homology search programs can be used as the search means for the computer

based systems of the present invention to accomplish comparison of target sequences and motifs. Computer programs to analyze expression levels in a sample and in controls are also known in the art.

5 A "target structural motif," or "target motif," refers to any rationally selected sequence or combination of sequences in which the sequence(s) are chosen based on a three-dimensional configuration that is formed upon the folding of the target motif, or on consensus sequences of regulatory or active sites. There are a variety of target motifs known in the art. Protein target motifs include, but are not limited to, enzyme active sites and signal sequences. Nucleic acid target motifs include, but are not limited to, hairpin structures, promoter sequences and other expression elements such as binding sites for transcription factors.

10 A variety of structural formats for the input and output means can be used to input and output the information in the computer-based systems of the present invention. One format for an output means ranks the relative expression levels of different polynucleotides. Such presentation provides a skilled artisan with a ranking of relative expression levels to determine a gene expression profile.

15 As discussed above, the "library" of the invention also encompasses biochemical libraries of the polynucleotides of SEQ ID NOS:1-6010, e.g., collections of nucleic acids representing the provided polynucleotides. The biochemical libraries can take a variety of forms, e.g., a solution of cDNAs, a pattern of probe nucleic acids stably associated with a surface of a solid support (i.e., an array) and the like. Of particular interest are nucleic acid arrays in which one or more of SEQ ID NOS:1-6010 is represented on the array. By array is meant an article of manufacture that has at least
20 a substrate with at least two distinct nucleic acid targets on one of its surfaces, where the number of distinct nucleic acids can be considerably higher, typically being at least 10, usually at least 20, and often at least 25 distinct nucleic acid molecules. A variety of different array formats have been developed and are known to those of skill in the art. The arrays of the subject invention find use in a variety of applications, including gene expression analysis, drug screening, mutation analysis and the
25 like, as disclosed in the above-listed exemplary patent documents.

In addition to the above nucleic acid libraries, analogous libraries of polypeptides are also provided, where the polypeptides of the library will represent at least a portion of the polypeptides encoded by a gene corresponding to one or more of SEQ ID NOS:1-6010.

Utilities

30 The polynucleotides of the invention are useful in a variety of applications. Exemplary utilities of the polynucleotides of the invention are described below.

Construction of Larger Molecules: Recombinant DNAs and Nucleic Acid Multimers. In one embodiment of particular interest, the polynucleotides described herein as useful as the building blocks for larger molecules. In one example, the polynucleotide is a component of a larger cDNA molecule

which in turn can be adapted for expression in a host cell (*e.g.*, a bacterial or eukaryotic (*e.g.*, yeast or mammalian) host cell). The cDNA can include, in addition to the polypeptide encoded by the starting material polynucleotide (*i.e.*, a polynucleotide described herein), an amino acid sequence that is heterologous to the polypeptide encoded by the polynucleotide described herein (*e.g.*, as in a sequence encoding a fusion protein). In some embodiments, the polynucleotides described herein is used as starting material polynucleotide for synthesizing all or a portion of the gene to which the described polynucleotide corresponds. For example, a DNA molecule encoding a full-length human polypeptide can be constructed using a polynucleotide described herein as starting material.

In another embodiment, the polynucleotides of the invention are used in nucleic acid multimers. Nucleic acid multimers can be linear or branched polymers of the same repeating single-stranded oligonucleotide unit or different single-stranded oligonucleotide units. Where the molecules are branched, the multimers are generally described as either "fork" or "comb" structures. The oligonucleotide units of the multimer may be composed of RNA, DNA, modified nucleotides or combinations thereof. At least one of the units has a sequence, length, and composition that permits it to bind specifically to a first single-stranded nucleotide sequence of interest, typically analyte or an oligonucleotide bound to the analyte. In order to achieve such specificity and stability, this unit will normally be 15 to 50 nt, preferably 15 to 30 nt, in length and have a GC content in the range of 40% to 60%. In addition to such unit(s), the multimer includes a multiplicity of units that are capable of hybridizing specifically and stably to a second single-stranded nucleotide of interest, typically a labeled oligonucleotide or another multimer. These units will also normally be 15 to 50 nt, preferably 15 to 30 nt, in length and have a GC content in the range of 40% to 60%. When a multimer is designed to be hybridized to another multimer, the first and second oligonucleotide units are heterogeneous (different). One or more of the polynucleotides described herein, or a portion of a polynucleotide described herein, can be used as a repeating unit of such nucleic acid multimers.

The total number of oligonucleotide units in the multimer will usually be in the range of 3 to 50, more usually 10 to 20. In multimers in which the unit that hybridizes to the nucleotide sequence of interest is different from the unit that hybridizes to the labeled oligonucleotide, the number ratio of the latter to the former will usually be 2:1 to 30:1, more usually 5:1 to 20:1, and-preferably 10:1 to 15:1.

The oligonucleotide units of the multimer may be covalently linked directly to each other through phosphodiester bonds or through interposed linking agents such as nucleic acid, amino acid, carbohydrate or polyol bridges, or through other cross-linking agents that are capable of cross-linking nucleic acid or modified nucleic acid strands. The site(s) of linkage may be at the ends of the unit (in either normal 3',-5' orientation or randomly oriented) and/or at one or more internal nucleotides in the strand. In linear multimers the individual units are linked end-to-end to form a linear polymer. In one

type of branched multimer three or more oligonucleotide units emanate from a point of origin to form a branched structure. The point of origin may be another oligonucleotide unit or a multifunctional molecule to which at least three units can be covalently bound. In another type, there is an oligonucleotide unit backbone with one or more pendant oligonucleotide units. These latter-type multimers are "fork-like", "comb-like" or combination "fork-" and "comb-like" in structure. The pendant units will normally depend from a modified nucleotide or other organic moiety having appropriate functional groups to which oligonucleotides may be conjugated or otherwise attached. The multimer may be totally linear, totally branched, or a combination of linear and branched portions. Preferably there will be at least two branch points in the multimer, more preferably at least 3, preferably 5 to 10. The multimer may include one or more segments of double-stranded sequences.

Multimeric nucleic acid molecules are useful in amplifying the signal that results from hybridization of one the first sequence of the multimeric molecule to a target sequence. The amplification is theoretically proportional to the number of iterations of the second segment.

Without being held to theory, forked structures of greater than about eight branches exhibited steric hindrance which inhibited binding of labeled probes to the multimer. On the other hand, comb structures exhibit little or no steric problems and are thus a preferred type of branched multimer. For a description of branched nucleic acid multimers of both the fork and comb types, as well as methods of use and synthesis, see, *e.g.*, U.S. Pat. Nos. 5,124,246 (fork-type structures); 5,710,264 (synthesis of comb structures); and 5,849,481.

Use of Polynucleotide Probes in Mapping, and in Tissue Profiling. Polynucleotide probes, generally comprising at least 12 contiguous nt of a polynucleotide as shown in the Sequence Listing, are used for a variety of purposes, such as chromosome mapping of the polynucleotide and detection of transcription levels. Additional disclosure about preferred regions of the disclosed polynucleotide sequences is found in the Examples. A probe that hybridizes specifically to a polynucleotide disclosed herein should provide a detection signal at least 5-, 10-, or 20-fold higher than the background hybridization provided with other unrelated sequences.

Detection of Expression Levels. Nucleotide probes are used to detect expression of a gene corresponding to the provided polynucleotide. In Northern blots, mRNA is separated electrophoretically and contacted with a probe. A probe is detected as hybridizing to an mRNA species of a particular size. The amount of hybridization is quantitated to determine relative amounts of expression, for example under a particular condition. Probes are used for in situ hybridization to cells to detect expression. Probes can also be used in vivo for diagnostic detection of hybridizing sequences. Probes are typically labeled with a radioactive isotope. Other types of detectable labels can be used

such as chromophores, fluors, and enzymes. Other examples of nucleotide hybridization assays are described in WO92/02526 and USPN 5,124,246.

Alternatively, the Polymerase Chain Reaction (PCR) is another means for detecting small amounts of target nucleic acids (see, e.g., Mullis et al., *Meth. Enzymol.* (1987) 155:335; USPN 4,683,195; and USPN 4,683,202). Two primer polynucleotides nucleotides that hybridize with the target nucleic acids are used to prime the reaction. The primers can be composed of sequence within or 3' and 5' to the polynucleotides of the Sequence Listing. Alternatively, if the primers are 3' and 5' to these polynucleotides, they need not hybridize to them or the complements. After amplification of the target with a thermostable polymerase, the amplified target nucleic acids can be detected by methods known in the art, e.g., Southern blot. mRNA or cDNA can also be detected by traditional blotting techniques (e.g., Southern blot, Northern blot, etc.) described in Sambrook et al., "Molecular Cloning: A Laboratory Manual" (New York, Cold Spring Harbor Laboratory, 1989) (e.g., without PCR amplification). In general, mRNA or cDNA generated from mRNA using a polymerase enzyme can be purified and separated using gel electrophoresis, and transferred to a solid support, such as nitrocellulose. The solid support is exposed to a labeled probe, washed to remove any unhybridized probe, and duplexes containing the labeled probe are detected.

Mapping. Polynucleotides of the present invention can be used to identify a chromosome on which the corresponding gene resides. Such mapping can be useful in identifying the function of the polynucleotide-related gene by its proximity to other genes with known function. Function can also be assigned to the polynucleotide-related gene when particular syndromes or diseases map to the same chromosome. For example, use of polynucleotide probes in identification and quantification of nucleic acid sequence aberrations is described in USPN 5,783,387. An exemplary mapping method is fluorescence in situ hybridization (FISH), which facilitates comparative genomic hybridization to allow total genome assessment of changes in relative copy number of DNA sequences (see, e.g., Valdes et al., *Methods in Molecular Biology* (1997) 68:1). Polynucleotides can also be mapped to particular chromosomes using, for example, radiation hybrids or chromosome-specific hybrid panels. See Leach et al., *Advances in Genetics*, (1995) 33:63-99; Walter et al., *Nature Genetics* (1994) 7:22; Walter and Goodfellow, *Trends in Genetics* (1992) 9:352. Panels for radiation hybrid mapping are available from Research Genetics, Inc., Huntsville, Alabama, USA. Databases for markers using various panels are available via the world wide web at sites supported by the Stanford Human Genome Center (Stanford University) and the Whitehead Institute for Biomedical Research/MIT Center for Genome Research. The statistical program RHMAP can be used to construct a map based on the data from radiation hybridization with a measure of the relative likelihood of one order versus another. RHMAP is available via the world wide web at a site supported by the University of Michigan. In addition,

commercial programs are available for identifying regions of chromosomes commonly associated with disease, such as cancer.

Tissue Typing or Profiling. Expression of specific mRNA corresponding to the provided polynucleotides can vary in different cell types and can be tissue-specific. This variation of mRNA levels in different cell types can be exploited with nucleic acid probe assays to determine tissue types. For example, PCR, branched DNA probe assays, or blotting techniques utilizing nucleic acid probes substantially identical or complementary to polynucleotides listed in the Sequence Listing can determine the presence or absence of the corresponding cDNA or mRNA.

Tissue typing can be used to identify the developmental organ or tissue source of a metastatic lesion by identifying the expression of a particular marker of that organ or tissue. If a polynucleotide is expressed only in a specific tissue type, and a metastatic lesion is found to express that polynucleotide, then the developmental source of the lesion has been identified. Expression of a particular polynucleotide can be assayed by detection of either the corresponding mRNA or the protein product. As would be readily apparent to any forensic scientist, the sequences disclosed herein are useful in differentiating human tissue from non-human tissue. In particular, these sequences are useful to differentiate human tissue from bird, reptile, and amphibian tissue, for example.

Use of Polymorphisms. A polynucleotide of the invention can be used in forensics, genetic analysis, mapping, and diagnostic applications where the corresponding region of a gene is polymorphic in the human population. Any means for detecting a polymorphism in a gene can be used, including, but not limited to electrophoresis of protein polymorphic variants, differential sensitivity to restriction enzyme cleavage, and hybridization to allele-specific probes.

Antibody Production. Expression products of a polynucleotide of the invention, as well as the corresponding mRNA, cDNA, or complete gene, can be prepared and used for raising antibodies for experimental, diagnostic, and therapeutic purposes. For polynucleotides to which a corresponding gene has not been assigned, this provides an additional method of identifying the corresponding gene. The polynucleotide or related cDNA is expressed as described above, and antibodies are prepared. These antibodies are specific to an epitope on the polypeptide encoded by the polynucleotide, and can precipitate or bind to the corresponding native protein in a cell or tissue preparation or in a cell-free extract of an in vitro expression system.

Methods for production of antibodies that specifically bind a selected antigen are well known in the art. Immunogens for raising antibodies can be prepared by mixing a polypeptide encoded by a polynucleotide of the invention with an adjuvant, and/or by making fusion proteins with larger immunogenic proteins. Polypeptides can also be covalently linked to other larger immunogenic proteins, such as keyhole limpet hemocyanin. Immunogens are typically administered intradermally,

subcutaneously, or intramuscularly to experimental animals such as rabbits, sheep, and mice, to generate antibodies. Monoclonal antibodies can be generated by isolating spleen cells and fusing myeloma cells to form hybridomas. Alternatively, the selected polynucleotide is administered directly, such as by intramuscular injection, and expressed in vivo. The expressed protein generates a variety of protein-specific immune responses, including production of antibodies, comparable to administration of the protein.

Preparations of polyclonal and monoclonal antibodies specific for polypeptides encoded by a selected polynucleotide are made using standard methods known in the art. The antibodies specifically bind to epitopes present in the polypeptides encoded by polynucleotides disclosed in the Sequence Listing. Typically, at least 6, 8, 10, or 12 contiguous amino acids are required to form an epitope. Epitopes that involve non-contiguous amino acids may require a longer polypeptide, e.g., at least 15, 25, or 50 amino acids. Antibodies that specifically bind to human polypeptides encoded by the provided polypeptides should provide a detection signal at least 5-, 10-, or 20-fold higher than a detection signal provided with other proteins when used in Western blots or other immunochemical assays. Preferably, antibodies that specifically bind polypeptides contemplated by the invention do not bind to other proteins in immunochemical assays at detectable levels and can immunoprecipitate the specific polypeptide from solution.

The invention also contemplates naturally occurring antibodies specific for a polypeptide of the invention. For example, serum antibodies to a polypeptide of the invention in a human population can be purified by methods well known in the art, e.g., by passing antiserum over a column to which the corresponding selected polypeptide or fusion protein is bound. The bound antibodies can then be eluted from the column, for example, using a buffer with a high salt concentration.

In addition to the antibodies discussed above, the invention also contemplates genetically engineered antibodies (e.g., chimeric antibodies, humanized antibodies, human antibodies produced by a transgenic animal (e.g., a transgenic mouse such as the Xenomous™), antibody derivatives (e.g., single chain antibodies, antibody fragments (e.g., Fab, etc.)), according to methods well known in the art.

Polynucleotides or Arrays for Diagnostics.

Polynucleotide arrays provide a high throughput technique that can assay a large number of polynucleotides in a sample. This technology can be used as a diagnostic and as tool to test for differential expression expression, e.g., to determine function of an encoded protein. A variety of methods of producing arrays, as well as variations of these methods, are known in the art and contemplated for use in the invention. For example, arrays can be created by spotting polynucleotide probes onto a substrate (e.g., glass, nitrocellulose, etc.) in a two-dimensional matrix or array having

bound probes. The probes can be bound to the substrate by either covalent bonds or by non-specific interactions, such as hydrophobic interactions. Samples of polynucleotides can be detectably labeled (e.g., using radioactive or fluorescent labels) and then hybridized to the probes. Double stranded polynucleotides, comprising the labeled sample polynucleotides bound to probe polynucleotides, can be detected once the unbound portion of the sample is washed away. Alternatively, the polynucleotides of the test sample can be immobilized on the array, and the probes detectably labeled. Techniques for constructing arrays and methods of using these arrays are described in, for example, Schena et al. (1996) *Proc Natl Acad Sci U S A.* 93(20):10614-9; Schena et al. (1995) *Science* 270(5235):467-70; Shalon et al. (1996) *Genome Res.* 6(7):639-45, USPN 5,807,522, EP 799 897; WO 97/29212; WO 97/27317; EP 785 280; WO 97/02357; USPN 5,593,839; USPN 5,578,832; EP 728 520; USPN 5,599,695; EP 721 016; USPN 5,556,752; WO 95/22058; and USPN 5,631,734.

Arrays can be used to, for example, examine differential expression of genes and can be used to determine gene function. For example, arrays can be used to detect differential expression of a gene corresponding to a polynucleotide of the invention, where expression is compared between a test cell and control cell (e.g., cancer cells and normal cells). For example, high expression of a particular message in a cancer cell, which is not observed in a corresponding normal cell, can indicate a cancer specific gene product. Exemplary uses of arrays are further described in, for example, Pappalarado et al., *Sem. Radiation Oncol.* (1998) 8:217; and Ramsay *Nature Biotechnol.* (1998) 16:40. Furthermore, many variations on methods of detection using arrays are well within the skill in the art and within the scope of the present invention. For example, rather than immobilizing the probe to a solid support, the test sample can be immobilized on a solid support which is then contacted with the probe.

Differential Expression in Diagnosis

The polynucleotides of the invention can also be used to detect differences in expression levels between two cells, e.g., as a method to identify abnormal or diseased tissue in a human. For polynucleotides corresponding to profiles of protein families, the choice of tissue can be selected according to the putative biological function. In general, the expression of a gene corresponding to a specific polynucleotide is compared between a first tissue that is suspected of being diseased and a second, normal tissue of the human. The tissue suspected of being abnormal or diseased can be derived from a different tissue type of the human, but preferably it is derived from the same tissue type; for example, an intestinal polyp or other abnormal growth should be compared with normal intestinal tissue. The normal tissue can be the same tissue as that of the test sample, or any normal tissue of the patient, especially those that express the polynucleotide-related gene of interest (e.g., brain, thymus, testis, heart, prostate, placenta, spleen, small intestine, skeletal muscle, pancreas, and the mucosal lining of the colon). A difference between the polynucleotide-related gene, mRNA, or protein in the

two tissues which are compared, for example, in molecular weight, amino acid or nucleotide sequence, or relative abundance, indicates a change in the gene, or a gene which regulates it, in the tissue of the human that was suspected of being diseased. Examples of detection of differential expression and its use in diagnosis of cancer are described in USPNs 5,688,641 and 5,677,125.

5 A genetic predisposition to disease in a human can also be detected by comparing expression levels of an mRNA or protein corresponding to a polynucleotide of the invention in a fetal tissue with levels associated in normal fetal tissue. Fetal tissues that are used for this purpose include, but are not limited to, amniotic fluid, chorionic villi, blood, and the blastomere of an in vitro-fertilized embryo. The comparable normal polynucleotide-related gene is obtained from any tissue. The mRNA or
10 protein is obtained from a normal tissue of a human in which the polynucleotide-related gene is expressed. Differences such as alterations in the nucleotide sequence or size of the same product of the fetal polynucleotide-related gene or mRNA, or alterations in the molecular weight, amino acid sequence, or relative abundance of fetal protein, can indicate a germline mutation in the polynucleotide-related gene of the fetus, which indicates a genetic predisposition to disease. In general, diagnostic,
15 prognostic, and other methods of the invention based on differential expression involve detection of a level or amount of a gene product, particularly a differentially expressed gene product, in a test sample obtained from a patient suspected of having or being susceptible to a disease (e.g., breast cancer, lung cancer, colon cancer and/or metastatic forms thereof), and comparing the detected levels to those levels found in normal cells (e.g., cells substantially unaffected by cancer) and/or other control cells (e.g., to
20 differentiate a cancerous cell from a cell affected by dysplasia). Furthermore, the severity of the disease can be assessed by comparing the detected levels of a differentially expressed gene product with those levels detected in samples representing the levels of differentially expressed gene product associated with varying degrees of severity of disease. It should be noted that use of the term
 “diagnostic” herein is not necessarily meant to exclude “prognostic” or “prognosis,” but rather is used
25 as a matter of convenience.

 The term “differentially expressed gene” is generally intended to encompass a polynucleotide that can, for example, include an open reading frame encoding a gene product (e.g., a polypeptide), and/or introns of such genes and adjacent 5' and 3' non-coding nucleotide sequences involved in the regulation of expression, up to about 20 kb beyond the coding region, but possibly further in either
30 direction. The gene can be introduced into an appropriate vector for extrachromosomal maintenance or for integration into a host genome. In general, a difference in expression level associated with a decrease in expression level of at least about 25%, usually at least about 50% to 75%, more usually at least about 90% or more is indicative of a differentially expressed gene of interest, i.e., a gene that is underexpressed or down-regulated in the test sample relative to a control sample. Furthermore, a

difference in expression level associated with an increase in expression of at least about 25%, usually at least about 50% to 75%, more usually at least about 90% and can be at least about 1½-fold, usually at least about 2-fold to about 10-fold, and can be about 100-fold to about 1,000-fold increase relative to a control sample is indicative of a differentially expressed gene of interest, i.e., an overexpressed or up-regulated gene.

"Differentially expressed polynucleotide" as used herein means a nucleic acid molecule (RNA or DNA) comprising a sequence that represents a differentially expressed gene, e.g., the differentially expressed polynucleotide comprises a sequence (e.g., an open reading frame encoding a gene product) that uniquely identifies a differentially expressed gene so that detection of the differentially expressed polynucleotide in a sample is correlated with the presence of a differentially expressed gene in a sample. "Differentially expressed polynucleotide" is also meant to encompass fragments of the disclosed polynucleotides, e.g., fragments retaining biological activity, as well as nucleic acids homologous, substantially similar, or substantially identical (e.g., having about 90% sequence identity) to the disclosed polynucleotides.

Methods of the subject invention useful in diagnosis or prognosis typically involve comparison of the abundance of a selected differentially expressed gene product in a sample of interest with that of a control to determine any relative differences in the expression of the gene product, where the difference can be measured qualitatively and/or quantitatively. Quantitation can be accomplished, for example, by comparing the level of expression product detected in the sample with the amounts of product present in a standard curve. A comparison can be made visually; by using a technique such as densitometry, with or without computerized assistance; by preparing a representative library of cDNA clones of mRNA isolated from a test sample, sequencing the clones in the library to determine that number of cDNA clones corresponding to the same gene product, and analyzing the number of clones corresponding to that same gene product relative to the number of clones of the same gene product in a control sample; or by using an array to detect relative levels of hybridization to a selected sequence or set of sequences, and comparing the hybridization pattern to that of a control. The differences in expression are then correlated with the presence or absence of an abnormal expression pattern. A variety of different methods for determining the nucleic acid abundance in a sample are known to those of skill in the art (see, e.g., WO 97/27317).

In general, diagnostic assays of the invention involve detection of a gene product of a polynucleotide sequence (e.g., mRNA or polypeptide) that corresponds to a sequence of SEQ ID NOS:1-6010. The patient from whom the sample is obtained can be apparently healthy, susceptible to disease (e.g., as determined by family history or exposure to certain environmental factors), or can

already be identified as having a condition in which altered expression of a gene product of the invention is implicated.

Diagnosis can be determined based on detected gene product expression levels of a gene product encoded by at least one, preferably at least two or more, at least 3 or more, or at least 4 or more of the polynucleotides having a sequence set forth in SEQ ID NOS:1-6010, and can involve detection of expression of genes corresponding to all of SEQ ID NOS:1-6010 and/or additional sequences that can serve as additional diagnostic markers and/or reference sequences. Where the diagnostic method is designed to detect the presence or susceptibility of a patient to cancer, the assay preferably involves detection of a gene product encoded by a gene corresponding to a polynucleotide that is differentially expressed in cancer. Examples of such differentially expressed polynucleotides are described in the Examples below. Given the provided polynucleotides and information regarding their relative expression levels provided herein, assays using such polynucleotides and detection of their expression levels in diagnosis and prognosis will be readily apparent to the ordinarily skilled artisan.

Any of a variety of detectable labels can be used in connection with the various embodiments of the diagnostic methods of the invention. Suitable detectable labels include fluorochromes, (e.g. fluorescein isothiocyanate (FITC), rhodamine, Texas Red, phycoerythrin, allophycocyanin, 6-carboxyfluorescein (6-FAM), 2',7'-dimethoxy-4',5'-dichloro-6-carboxyfluorescein, 6-carboxy-X-rhodamine (ROX), 6-carboxy-2',4',7',4,7-hexachlorofluorescein (HEX), 5-carboxyfluorescein (5-FAM) or N,N,N',N'-tetramethyl-6-carboxyrhodamine (TAMRA)), radioactive labels, (e.g. 32P, 35S, 3H, etc.), and the like. The detectable label can involve a two stage systems (e.g., biotin-avidin, hapten-anti-hapten antibody, etc.).

Reagents specific for the polynucleotides and polypeptides of the invention, such as antibodies and nucleotide probes, can be supplied in a kit for detecting the presence of an expression product in a biological sample. The kit can also contain buffers or labeling components, as well as instructions for using the reagents to detect and quantify expression products in the biological sample. Exemplary embodiments of the diagnostic methods of the invention are described below in more detail.

Polypeptide detection in diagnosis. In one embodiment, the test sample is assayed for the level of a differentially expressed polypeptide. Diagnosis can be accomplished using any of a number of methods to determine the absence or presence or altered amounts of the differentially expressed polypeptide in the test sample. For example, detection can utilize staining of cells or histological sections with labeled antibodies, performed in accordance with conventional methods. Cells can be permeabilized to stain cytoplasmic molecules. In general, antibodies that specifically bind a differentially expressed polypeptide of the invention are added to a sample, and incubated for a period of time sufficient to allow binding to the epitope, usually at least about 10 minutes. The antibody can

be detectably labeled for direct detection (e.g., using radioisotopes, enzymes, fluorescers, chemiluminescers, and the like), or can be used in conjunction with a second stage antibody or reagent to detect binding (e.g., biotin with horseradish peroxidase-conjugated avidin, a secondary antibody conjugated to a fluorescent compound, e.g. fluorescein, rhodamine, Texas red, etc.). The absence or
5 presence of antibody binding can be determined by various methods, including flow cytometry of dissociated cells, microscopy, radiography, scintillation counting, etc. Any suitable alternative methods of qualitative or quantitative detection of levels or amounts of differentially expressed polypeptide can be used, for example, ELISA, western blot, immunoprecipitation, radioimmunoassay, etc.

10 mRNA detection. The diagnostic methods of the invention can also or alternatively involve detection of mRNA encoded by a gene corresponding to a differentially expressed polynucleotide of the invention. Any suitable qualitative or quantitative methods known in the art for detecting specific mRNAs can be used. mRNA can be detected by, for example, in situ hybridization in tissue sections, by reverse transcriptase-PCR, or in Northern blots containing poly A+ mRNA. One of skill in the art
15 can readily use these methods to determine differences in the size or amount of mRNA transcripts between two samples. mRNA expression levels in a sample can also be determined by generation of a library of expressed sequence tags (ESTs) from the sample, where the EST library is representative of sequences present in the sample (Adams, et al., (1991) Science 252:1651). Enumeration of the relative representation of ESTs within the library can be used to approximate the relative representation of the
20 gene transcript within the starting sample. The results of EST analysis of a test sample can then be compared to EST analysis of a reference sample to determine the relative expression levels of a selected polynucleotide, particularly a polynucleotide corresponding to one or more of the differentially expressed genes described herein. Alternatively, gene expression in a test sample can be performed using serial analysis of gene expression (SAGE) methodology (e.g., Velculescu et al., Science (1995)
25 270:484) or differential display (DD) methodology (see, e.g., USPN 5,776,683 and USPN 5,807,680).

Alternatively, gene expression can be analyzed using hybridization analysis. Oligonucleotides or cDNA can be used to selectively identify or capture DNA or RNA of specific sequence composition, and the amount of RNA or cDNA hybridized to a known capture sequence determined qualitatively or quantitatively, to provide information about the relative representation of a particular message within
30 the pool of cellular messages in a sample. Hybridization analysis can be designed to allow for concurrent screening of the relative expression of hundreds to thousands of genes by using, for example, array-based technologies having high density formats, including filters, microscope slides, or microchips, or solution-based technologies that use spectroscopic analysis (e.g., mass spectrometry).

One exemplary use of arrays in the diagnostic methods of the invention is described below in more detail.

Use of a single gene in diagnostic applications. The diagnostic methods of the invention can focus on the expression of a single differentially expressed gene. For example, the diagnostic method
5 can involve detecting a differentially expressed gene, or a polymorphism of such a gene (e.g., a polymorphism in a coding region or control region), that is associated with disease. Disease-associated polymorphisms can include deletion or truncation of the gene, mutations that alter expression level and/or affect activity of the encoded protein, etc.

A number of methods are available for analyzing nucleic acids for the presence of a specific
10 sequence, e.g. a disease associated polymorphism. Where large amounts of DNA are available, genomic DNA is used directly. Alternatively, the region of interest is cloned into a suitable vector and grown in sufficient quantity for analysis. Cells that express a differentially expressed gene can be used as a source of mRNA, which can be assayed directly or reverse transcribed into cDNA for analysis. The nucleic acid can be amplified by conventional techniques, such as the polymerase chain reaction
15 (PCR), to provide sufficient amounts for analysis, and a detectable label can be included in the amplification reaction (e.g., using a detectably labeled primer or detectably labeled oligonucleotides) to facilitate detection. Alternatively, various methods are also known in the art that utilize oligonucleotide ligation as a means of detecting polymorphisms, see, e.g., Riley et al., Nucl. Acids Res. (1990) 18:2887; and Delahunty et al., Am. J. Hum. Genet. (1996) 58:1239.

20 The amplified or cloned sample nucleic acid can be analyzed by one of a number of methods known in the art. The nucleic acid can be sequenced by dideoxy or other methods, and the sequence of bases compared to a selected sequence, e.g., to a wild-type sequence. Hybridization with the polymorphic or variant sequence can also be used to determine its presence in a sample (e.g., by Southern blot, dot blot, etc.). The hybridization pattern of a polymorphic or variant sequence and a
25 control sequence to an array of oligonucleotide probes immobilized on a solid support, as described in US 5,445,934, or in WO 95/35505, can also be used as a means of identifying polymorphic or variant sequences associated with disease. Single strand conformational polymorphism (SSCP) analysis, denaturing gradient gel electrophoresis (DGGE), and heteroduplex analysis in gel matrices are used to detect conformational changes created by DNA sequence variation as alterations in electrophoretic
30 mobility. Alternatively, where a polymorphism creates or destroys a recognition site for a restriction endonuclease, the sample is digested with that endonuclease, and the products size fractionated to determine whether the fragment was digested. Fractionation is performed by gel or capillary electrophoresis, particularly acrylamide or agarose gels.

Screening for mutations in a gene can be based on the functional or antigenic characteristics of the protein. Protein truncation assays are useful in detecting deletions that can affect the biological activity of the protein. Various immunoassays designed to detect polymorphisms in proteins can be used in screening. Where many diverse genetic mutations lead to a particular disease phenotype, functional protein assays have proven to be effective screening tools. The activity of the encoded protein can be determined by comparison with the wild-type protein.

Diagnosis, Prognosis, Assessment of Therapy (Therapeutics), and Management of Cancer

The polynucleotides of the invention, as well as their gene products, are of particular interest as genetic or biochemical markers (e.g., in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or to monitor the efficacy of various therapies and preventive interventions. For example, the level of expression of certain polynucleotides can be indicative of a poorer prognosis, and therefore warrant more aggressive chemo- or radio-therapy for a patient or vice versa. The correlation of novel surrogate tumor specific features with response to treatment and outcome in patients can define prognostic indicators that allow the design of tailored therapy based on the molecular profile of the tumor. These therapies include antibody targeting, antagonists (e.g., small molecules), and gene therapy. Determining expression of certain polynucleotides and comparison of a patient's profile with known expression in normal tissue and variants of the disease allows a determination of the best possible treatment for a patient, both in terms of specificity of treatment and in terms of comfort level of the patient. Surrogate tumor markers, such as polynucleotide expression, can also be used to better classify, and thus diagnose and treat, different forms and disease states of cancer. Two classifications widely used in oncology that can benefit from identification of the expression levels of the genes corresponding to the polynucleotides of the invention are staging of the cancerous disorder, and grading the nature of the cancerous tissue.

The polynucleotides that correspond to differentially expressed genes, as well as their encoded gene products, can be useful to monitor patients having or susceptible to cancer to detect potentially malignant events at a molecular level before they are detectable at a gross morphological level. In addition, the polynucleotides of the invention, as well as the genes corresponding to such polynucleotides, can be useful as therapeutics, e.g., to assess the effectiveness of therapy by using the polynucleotides or their encoded gene products, to assess, for example, tumor burden in the patient before, during, and after therapy.

Furthermore, a polynucleotide identified as corresponding to a gene that is differentially expressed in, and thus is important for, one type of cancer can also have implications for development or risk of development of other types of cancer, e.g., where a polynucleotide represents a gene differentially expressed across various cancer types. Thus, for example, expression of a polynucleotide

corresponding to a gene that has clinical implications for metastatic colon cancer can also have clinical implications for stomach cancer or endometrial cancer.

Staging. Staging is a process used by physicians to describe how advanced the cancerous state is in a patient. Staging assists the physician in determining a prognosis, planning treatment and evaluating the results of such treatment. Staging systems vary with the types of cancer, but generally involve the following "TNM" system: the type of tumor, indicated by T; whether the cancer has metastasized to nearby lymph nodes, indicated by N; and whether the cancer has metastasized to more distant parts of the body, indicated by M. Generally, if a cancer is only detectable in the area of the primary lesion without having spread to any lymph nodes it is called Stage I. If it has spread only to the closest lymph nodes, it is called Stage II. In Stage III, the cancer has generally spread to the lymph nodes in near proximity to the site of the primary lesion. Cancers that have spread to a distant part of the body, such as the liver, bone, brain or other site, are Stage IV, the most advanced stage.

The polynucleotides of the invention can facilitate fine-tuning of the staging process by identifying markers for the aggressivity of a cancer, e.g., the metastatic potential, as well as the presence in different areas of the body. Thus, a Stage II cancer with a polynucleotide signifying a high metastatic potential cancer can be used to change a borderline Stage II tumor to a Stage III tumor, justifying more aggressive therapy. Conversely, the presence of a polynucleotide signifying a lower metastatic potential allows more conservative staging of a tumor.

Grading of cancers. Grade is a term used to describe how closely a tumor resembles normal tissue of its same type. The microscopic appearance of a tumor is used to identify tumor grade based on parameters such as cell morphology, cellular organization, and other markers of differentiation. As a general rule, the grade of a tumor corresponds to its rate of growth or aggressiveness, with undifferentiated or high-grade tumors being more aggressive than well-differentiated or low-grade tumors. The following guidelines are generally used for grading tumors: 1) GX Grade cannot be assessed; 2) G1 Well differentiated; 3) G2 Moderately well differentiated; 4) G3 Poorly differentiated; 5) G4 Undifferentiated. The polynucleotides of the invention can be especially valuable in determining the grade of the tumor, as they not only can aid in determining the differentiation status of the cells of a tumor, they can also identify factors other than differentiation that are valuable in determining the aggressiveness of a tumor, such as metastatic potential.

Detection of colon cancer. The polynucleotides corresponding to genes that exhibit the appropriate expression pattern can be used to detect colon cancer in a subject. Colorectal cancer is one of the most common neoplasms in humans and perhaps the most frequent form of hereditary neoplasia. Prevention and early detection are key factors in controlling and curing colorectal cancer. Colorectal cancer begins as polyps, which are small, benign growths of cells that form on the inner lining of the

colon. Over a period of several years, some of these polyps accumulate additional mutations and become cancerous. Multiple familial colorectal cancer disorders have been identified, which are summarized as follows: 1) Familial adenomatous polyposis (FAP); 2) Gardner's syndrome; 3) Hereditary nonpolyposis colon cancer (HNPCC); and 4) Familial colorectal cancer in Ashkenazi Jews.

- 5 The expression of appropriate polynucleotides of the invention can be used in the diagnosis, prognosis and management of colorectal cancer. Detection of colon cancer can be determined using expression levels of any of these sequences alone or in combination with the levels of expression. Determination of the aggressive nature and/or the metastatic potential of a colon cancer can be determined by comparing levels of one or more polynucleotides of the invention and comparing total levels of another
- 10 sequence known to vary in cancerous tissue, e.g., expression of p53, DCC ras, or FAP (see, e.g., Fearon ER, et al., Cell (1990) 61(5):759; Hamilton SR et al., Cancer (1993) 72:957; Bodmer W, et al., Nat Genet. (1994) 4(3):217; Fearon ER, Ann N Y Acad Sci. (1995) 768:101). For example, development of colon cancer can be detected by examining the ratio of any of the polynucleotides of the invention to the levels of oncogenes (e.g., ras) or tumor suppressor genes (e.g., FAP or p53). Thus,
- 15 expression of specific marker polynucleotides can be used to discriminate between normal and cancerous colon tissue, to discriminate between colon cancers with different cells of origin, to discriminate between colon cancers with different potential metastatic rates, etc. For a review of markers of cancer, see, e.g., Hanahan et al. (2000) Cell 100:57-70.

- Detection of prostate cancer. The polynucleotides and their corresponding genes and gene
- 20 products exhibiting the appropriate differential expression pattern can be used to detect prostate cancer in a subject. Over 95% of primary prostate cancers are adenocarcinomas. Signs and symptoms may include: frequent urination, especially at night; inability to urinate; trouble starting or holding back urination; a weak or interrupted urine flow; and frequent pain or stiffness in the lower back, hips or upper thighs.

- 25 Many of the signs and symptoms of prostate cancer can be caused by a variety of other non-cancerous conditions. For example, one common cause of many of these signs and symptoms is a condition called benign prostatic hypertrophy, or BPH. In BPH, the prostate gets bigger and may block the flow of urine or interfere with sexual function. The methods and compositions of the invention can be used to distinguish between prostate cancer and such non-cancerous conditions. The methods of the
- 30 invention can be used in conjunction with conventional methods of diagnosis, e.g., digital rectal exam and/or detection of the level of prostate specific antigen (PSA), a substance produced and secreted by the prostate.

Detection of breast cancer. The majority of breast cancers are adenocarcinoma subtypes, which can be summarized as follows: 1) ductal carcinoma in situ (DCIS), including comedocarcinoma;

2) infiltrating (or invasive) ductal carcinoma (IDC); 3) lobular carcinoma in situ (LCIS); 4) infiltrating (or invasive) lobular carcinoma (ILC); 5) inflammatory breast cancer; 6) medullary carcinoma; 7) mucinous carcinoma; 8) Paget's disease of the nipple; 9) Phyllodes tumor; and 10) tubular carcinoma;

The expression of polynucleotides of the invention can be used in the diagnosis and management of breast cancer, as well as to distinguish between types of breast cancer. Detection of breast cancer can be determined using expression levels of any of the appropriate polynucleotides of the invention, either alone or in combination. Determination of the aggressive nature and/or the metastatic potential of a breast cancer can also be determined by comparing levels of one or more polynucleotides of the invention and comparing levels of another sequence known to vary in cancerous tissue, e.g., ER expression. In addition, development of breast cancer can be detected by examining the ratio of expression of a differentially expressed polynucleotide to the levels of steroid hormones (e.g., testosterone or estrogen) or to other hormones (e.g., growth hormone, insulin). Thus, expression of specific marker polynucleotides can be used to discriminate between normal and cancerous breast tissue, to discriminate between breast cancers with different cells of origin, to discriminate between breast cancers with different potential metastatic rates, etc.

Detection of lung cancer. The polynucleotides of the invention can be used to detect lung cancer in a subject. Although there are more than a dozen different kinds of lung cancer, the two main types of lung cancer are small cell and nonsmall cell, which encompass about 90% of all lung cancer cases. Small cell carcinoma (also called oat cell carcinoma) usually starts in one of the larger bronchial tubes, grows fairly rapidly, and is likely to be large by the time of diagnosis. Nonsmall cell lung cancer (NSCLC) is made up of three general subtypes of lung cancer. Epidermoid carcinoma (also called squamous cell carcinoma) usually starts in one of the larger bronchial tubes and grows relatively slowly. The size of these tumors can range from very small to quite large. Adenocarcinoma starts growing near the outside surface of the lung and can vary in both size and growth rate. Some slowly growing adenocarcinomas are described as alveolar cell cancer. Large cell carcinoma starts near the surface of the lung, grows rapidly, and the growth is usually fairly large when diagnosed. Other less common forms of lung cancer are carcinoid, cylindroma, mucoepidermoid, and malignant mesothelioma.

The polynucleotides of the invention, e.g., polynucleotides differentially expressed in normal cells versus cancerous lung cells (e.g., tumor cells of high or low metastatic potential) or between types of cancerous lung cells (e.g., high metastatic versus low metastatic), can be used to distinguish types of lung cancer as well as identifying traits specific to a certain patient's cancer and selecting an appropriate therapy. For example, if the patient's biopsy expresses a polynucleotide that is associated with a low metastatic potential, it may justify leaving a larger portion of the patient's lung in surgery to

remove the lesion. Alternatively, a smaller lesion with expression of a polynucleotide that is associated with high metastatic potential may justify a more radical removal of lung tissue and/or the surrounding lymph nodes, even if no metastasis can be identified through pathological examination.

Use of Polynucleotides to Screen for Peptide Analogs and Antagonists

5 Polypeptides encoded by the instant polynucleotides and corresponding full-length genes can be used to screen peptide libraries to identify binding partners, such as receptors, from among the encoded polypeptides. Peptide libraries can be synthesized according to methods known in the art (see, e.g., USPN 5,010,175, and WO 91/17823). Agonists or antagonists of the polypeptides of the invention can be screened using any available method known in the art, such as signal transduction, 10 antibody binding, receptor binding, mitogenic assays, chemotaxis assays, etc. The assay conditions ideally should resemble the conditions under which the native activity is exhibited in vivo, that is, under physiologic pH, temperature, and ionic strength. Suitable agonists or antagonists will exhibit strong inhibition or enhancement of the native activity at concentrations that do not cause toxic side effects in the subject. Agonists or antagonists that compete for binding to the native polypeptide can require 15 concentrations equal to or greater than the native concentration, while inhibitors capable of binding irreversibly to the polypeptide can be added in concentrations on the order of the native concentration.

Such screening and experimentation can lead to identification of a novel polypeptide binding partner, such as a receptor, encoded by a gene or a cDNA corresponding to a polynucleotide of the invention, and at least one peptide agonist or antagonist of the novel binding partner. Such agonists 20 and antagonists can be used to modulate, enhance, or inhibit receptor function in cells to which the receptor is native, or in cells that possess the receptor as a result of genetic engineering. Further, if the novel receptor shares biologically important characteristics with a known receptor, information about agonist/antagonist binding can facilitate development of improved agonists/antagonists of the known receptor.

25 Pharmaceutical Compositions and Uses

Pharmaceutical compositions can comprise polypeptides, receptors that specifically bind a polypeptide produced by a differentially expressed gene (e.g., antibodies, or polynucleotides (including antisense nucleotides and ribozymes) of the claimed invention in a therapeutically effective amount. The compositions can be used to treat primary tumors as well as metastases of primary tumors. In 30 addition, the pharmaceutical compositions can be used in conjunction with conventional methods of cancer treatment, e.g., to sensitize tumors to radiation or conventional chemotherapy.

Where the pharmaceutical composition comprises a receptor (such as an antibody) that specifically binds to a gene product encoded by a differentially expressed gene, the receptor can be coupled to a drug for delivery to a treatment site or coupled to a detectable label to facilitate imaging of

a site comprising colon cancer cells. Methods for coupling antibodies to drugs and detectable labels are well known in the art, as are methods for imaging using detectable labels.

The term "therapeutically effective amount" as used herein refers to an amount of a therapeutic agent to treat, ameliorate, or prevent a desired disease or condition, or to exhibit a detectable therapeutic or preventative effect. The effect can be detected by, for example, chemical markers or antigen levels. Therapeutic effects also include reduction in physical symptoms, such as decreased body temperature. The precise effective amount for a subject will depend upon the subject's size and health, the nature and extent of the condition, and the therapeutics or combination of therapeutics selected for administration. Thus, it is not useful to specify an exact effective amount in advance. However, the effective amount for a given situation is determined by routine experimentation and is within the judgment of the clinician. For purposes of the present invention, an effective dose will generally be from about 0.01 mg/kg to 50 mg/kg or 0.05 mg/kg to about 10 mg/kg of the DNA constructs in the individual to which it is administered.

A pharmaceutical composition can also contain a pharmaceutically acceptable carrier. The term "pharmaceutically acceptable carrier" refers to a carrier for administration of a therapeutic agent, such as antibodies or a polypeptide, genes, and other therapeutic agents. The term refers to any pharmaceutical carrier that does not itself induce the production of antibodies harmful to the individual receiving the composition, and which can be administered without undue toxicity. Suitable carriers can be large, slowly metabolized macromolecules such as proteins, polysaccharides, polylactic acids, polyglycolic acids, polymeric amino acids, amino acid copolymers, and inactive virus particles. Such carriers are well known to those of ordinary skill in the art. Pharmaceutically acceptable carriers in therapeutic compositions can include liquids such as water, saline, glycerol and ethanol. Auxiliary substances, such as wetting or emulsifying agents, pH buffering substances, and the like, can also be present in such vehicles. Typically, the therapeutic compositions are prepared as injectables, either as liquid solutions or suspensions; solid forms suitable for solution in, or suspension in, liquid vehicles prior to injection can also be prepared. Liposomes are included within the definition of a pharmaceutically acceptable carrier. Pharmaceutically acceptable salts can also be present in the pharmaceutical composition, e.g., mineral acid salts such as hydrochlorides, hydrobromides, phosphates, sulfates, and the like; and the salts of organic acids such as acetates, propionates, malonates, benzoates, and the like. A thorough discussion of pharmaceutically acceptable excipients is available in Remington's Pharmaceutical Sciences (Mack Pub. Co., N.J. 1991).

Delivery Methods

Once formulated, the compositions of the invention can be (1) administered directly to the subject (e.g., as polynucleotide or polypeptides); or (2) delivered ex vivo, to cells derived from the

subject (e.g., as in ex vivo gene therapy). Direct delivery of the compositions will generally be accomplished by parenteral injection, e.g., subcutaneously, intraperitoneally, intravenously or intramuscularly, intratumorally or to the interstitial space of a tissue. Other modes of administration include oral and pulmonary administration, suppositories, and transdermal applications, needles, and gene guns or hyposprays. Dosage treatment can be a single dose schedule or a multiple dose schedule.

Methods for the ex vivo delivery and reimplantation of transformed cells into a subject are known in the art and described in, e.g., WO 93/14778. Examples of cells useful in ex vivo applications include, for example, stem cells, particularly hematopoietic, lymph cells, macrophages, dendritic cells, or tumor cells. Generally, delivery of nucleic acids for both ex vivo and in vitro applications can be accomplished by, for example, dextran-mediated transfection, calcium phosphate precipitation, polybrene mediated transfection, protoplast fusion, electroporation, encapsulation of the polynucleotide(s) in liposomes, and direct microinjection of the DNA into nuclei, all well known in the art.

Once differential expression of a gene corresponding to a polynucleotide of the invention has been found to correlate with a proliferative disorder, such as neoplasia, dysplasia, and hyperplasia, the disorder can be amenable to treatment by administration of a therapeutic agent based on the provided polynucleotide, corresponding polypeptide or other corresponding molecule (e.g., antisense, ribozyme, etc.). In other embodiments, the disorder can be amenable to treatment by administration of a small molecule drug that, for example, serves as an inhibitor (antagonist) of the function of the encoded gene product of a gene having increased expression in cancerous cells relative to normal cells or as an agonist for gene products that are decreased in expression in cancerous cells (e.g., to promote the activity of gene products that act as tumor suppressors).

The dose and the means of administration of the inventive pharmaceutical compositions are determined based on the specific qualities of the therapeutic composition, the condition, age, and weight of the patient, the progression of the disease, and other relevant factors. For example, administration of polynucleotide therapeutic composition agents of the invention includes local or systemic administration, including injection, oral administration, particle gun or catheterized administration, and topical administration. Preferably, the therapeutic polynucleotide composition contains an expression construct comprising a promoter operably linked to a polynucleotide of at least 12, 22, 25, 30, or 35 contiguous nt of the polynucleotide of the invention. Various methods can be used to administer the therapeutic composition directly to a specific site in the body. For example, a small metastatic lesion is located and the therapeutic composition injected several times in several different locations within the body of tumor. Alternatively, arteries that serve a tumor are identified, and the therapeutic composition injected into such an artery, in order to deliver the composition directly into

the tumor. A tumor that has a necrotic center is aspirated and the composition injected directly into the now empty center of the tumor. The antisense composition is directly administered to the surface of the tumor, for example, by topical application of the composition. X-ray imaging is used to assist in certain of the above delivery methods.

5 Targeted delivery of therapeutic compositions containing an antisense polynucleotide, subgenomic polynucleotides, or antibodies to specific tissues can also be used. Receptor-mediated DNA delivery techniques are described in, for example, Findeis et al., Trends Biotechnol. (1993) 11:202; Chiou et al., Gene Therapeutics: Methods And Applications Of Direct Gene Transfer (J.A. Wolff, ed.) (1994); Wu et al., J. Biol. Chem. (1988) 263:621; Wu et al., J. Biol. Chem. (1994) 10 269:542; Zenke et al., Proc. Natl. Acad. Sci. (USA) (1990) 87:3655; Wu et al., J. Biol. Chem. (1991) 266:338. Therapeutic compositions containing a polynucleotide are administered in a range of about 100 ng to about 200 mg of DNA for local administration in a gene therapy protocol. Concentration ranges of about 500 ng to about 50 mg, about 1 micrograms to about 2 mg, about 5 micrograms to about 500 micrograms, and about 20 micrograms to about 100 micrograms of DNA can also be used 15 during a gene therapy protocol. Factors such as method of action (e.g., for enhancing or inhibiting levels of the encoded gene product) and efficacy of transformation and expression are considerations which will affect the dosage required for ultimate efficacy of the antisense subgenomic polynucleotides. Where greater expression is desired over a larger area of tissue, larger amounts of antisense subgenomic polynucleotides or the same amounts readministered in a successive protocol of 20 administrations, or several administrations to different adjacent or close tissue portions of, for example, a tumor site, may be required to effect a positive therapeutic outcome. In all cases, routine experimentation in clinical trials will determine specific ranges for optimal therapeutic effect. For polynucleotide related genes encoding polypeptides or proteins with anti-inflammatory activity, suitable use, doses, and administration are described in USPN 5,654,173.

25 The therapeutic polynucleotides and polypeptides of the present invention can be delivered using gene delivery vehicles. The gene delivery vehicle can be of viral or non-viral origin (see generally, Jolly, Cancer Gene Therapy (1994) 1:51; Kimura, Human Gene Therapy (1994) 5:845; Connelly, Human Gene Therapy (1995) 1:185; and Kaplitt, Nature Genetics (1994) 6:148). Expression of such coding sequences can be induced using endogenous mammalian or heterologous 30 promoters. Expression of the coding sequence can be either constitutive or regulated.

Viral-based vectors for delivery of a desired polynucleotide and expression in a desired cell are well known in the art. Exemplary viral-based vehicles include, but are not limited to, recombinant retroviruses (see, e.g., WO 90/07936; WO 94/03622; WO 93/25698; WO 93/25234; USPN 5, 219,740; WO 93/11230; WO 93/10218; USPN 4,777,127; GB Patent No. 2,200,651; EP 0 345 242;

and WO 91/02805), alphavirus-based vectors (e.g., Sindbis virus vectors, Semliki forest virus (ATCC VR-67; ATCC VR-1247), Ross River virus (ATCC VR-373; ATCC VR-1246) and Venezuelan equine encephalitis virus (ATCC VR-923; ATCC VR-1250; ATCC VR 1249; ATCC VR-532), and adeno-associated virus (AAV) vectors (see, e.g., WO 94/12649, WO 93/03769; WO 93/19191; WO 94/28938; WO 95/11984 and WO 95/00655). Administration of DNA linked to killed adenovirus, as described in Curiel, Hum. Gene Ther. (1992) 3:147, can also be employed.

Non-viral delivery vehicles and methods can also be employed, including, but not limited to, polycationic condensed DNA linked or unlinked to killed adenovirus alone (see, e.g., Curiel, Hum. Gene Ther. (1992) 3:147); ligand-linked DNA (see, e.g., Wu, J. Biol. Chem. (1989) 264:16985); eukaryotic cell delivery vehicles cells (see, e.g., USPN 5,814,482; WO 95/07994; WO 96/17072; WO 95/30763; and WO 97/42338) and nucleic charge neutralization or fusion with cell membranes. Naked DNA can also be employed. Exemplary naked DNA introduction methods are described in WO 90/11092 and USPN 5,580,859. Liposomes that can act as gene delivery vehicles are described in USPN 5,422,120; WO 95/13796; WO 94/23697; WO 91/14445; and EP 0524968. Additional approaches are described in Philip, Mol. Cell Biol. (1994) 14:2411, and in Woffendin, Proc. Natl. Acad. Sci. (1994) 91:1581

Further non-viral delivery suitable for use includes mechanical delivery systems such as the approach described in Woffendin et al., Proc. Natl. Acad. Sci. USA (1994) 91(24):11581. Moreover, the coding sequence and the product of expression of such can be delivered through deposition of photopolymerized hydrogel materials or use of ionizing radiation (see, e.g., USPN 5,206,152 and WO 92/11033). Other conventional methods for gene delivery that can be used for delivery of the coding sequence include, for example, use of hand-held gene transfer particle gun (see, e.g., USPN 5,149,655); use of ionizing radiation for activating transferred gene (see, e.g., USPN 5,206,152 and WO 92/11033).

The present invention will now be illustrated by reference to the following examples which set forth particularly advantageous embodiments. However, it should be noted that these embodiments are illustrative and are not to be construed as restricting the invention in any way.

EXAMPLES

The following examples are put forth so as to provide those of ordinary skill in the art with a complete disclosure and description of how to make and use the present invention, and are not intended to limit the scope of what the inventors regard as their invention nor are they intended to represent that the experiments below are all or the only experiments performed. It will be readily apparent to those skilled in the art that the formulations, dosages, methods of administration, and other parameters of

this invention may be further modified or substituted in various ways without departing from the spirit and scope of the invention. Efforts have been made to ensure accuracy with respect to numbers used (e.g. amounts, temperature, etc.) but some experimental errors and deviations should be accounted for. Unless indicated otherwise, parts are parts by weight, molecular weight is weight average molecular weight, temperature is in degrees Centigrade, and pressure is at or near atmospheric.

Example 1: Source of Biological Materials and Overview of Novel Polynucleotides Expressed by the Biological Materials

Candidate polynucleotides that may represent novel polynucleotides were obtained from cDNA libraries generated from selected cell lines and patient tissues. In order to obtain the candidate polynucleotides, mRNA was isolated from several selected cell lines and patient tissues, and used to construct cDNA libraries. The cells and tissues that served as sources for these cDNA libraries are summarized in Table 1 below.

Human colon cancer cell line Km12L4-A (Morikawa, et al., Cancer Research (1988) 48:6863) is derived from the KM12C cell line. The KM12C cell line (Morikawa et al. Cancer Res. (1988) 48:1943-1948), which is poorly metastatic (low metastatic) was established in culture from a Dukes' stage B2 surgical specimen (Morikawa et al. Cancer Res. (1988) 48:6863). The KM12L4-A is a highly metastatic subline derived from KM12C (Yeatman et al. Nucl. Acids. Res. (1995) 23:4007; Bao-Ling et al. Proc. Annu. Meet. Am. Assoc. Cancer. Res. (1995) 21:3269). The KM12C and KM12C-derived cell lines (e.g., KM12L4, KM12L4-A, etc.) are well-recognized in the art as a model cell line for the study of colon cancer (see, e.g., Moriakawa et al., supra; Radinsky et al. Clin. Cancer Res. (1995) 1:19; Yeatman et al., (1995) supra; Yeatman et al. Clin. Exp. Metastasis (1996) 14:246).

The MDA-MB-231 cell line (Brinkley et al. Cancer Res. (1980) 40:3118-3129) was originally isolated from pleural effusions (Cailleau, J. Natl. Cancer. Inst. (1974) 53:661), is of high metastatic potential, and forms poorly differentiated adenocarcinoma grade II in nude mice consistent with breast carcinoma. The MCF7 cell line was derived from a pleural effusion of a breast adenocarcinoma and is non-metastatic. The MV-522 cell line is derived from a human lung carcinoma and is of high metastatic potential. The UCP-3 cell line is a low metastatic human lung carcinoma cell line; the MV-522 is a high metastatic variant of UCP-3. These cell lines are well-recognized in the art as models for the study of human breast and lung cancer (see, e.g., Chandrasekaran et al., Cancer Res. (1979) 39:870 (MDA-MB-231 and MCF-7); Gastpar et al., J Med Chem (1998) 41:4965 (MDA-MB-231 and MCF-7); Ranson et al., Br J Cancer (1998) 77:1586 (MDA-MB-231 and MCF-7); Kuang et al., Nucleic Acids Res (1998) 26:1116 (MDA-MB-231 and MCF-7); Varki et al., Int J Cancer (1987) 40:46 (UCP-3); Varki et al., Tumour Biol. (1990) 11:327; (MV-522 and UCP-3); Varki et al., Anticancer

Res. (1990) 10:637; (MV-522); Kelner et al., Anticancer Res (1995) 15:867 (MV-522); and Zhang et al., Anticancer Drugs (1997) 8:696 (MV522)).

The samples of libraries 15-20 are derived from two different patients (UC#2, and UC#3). The bFGF-treated HMVEC were prepared by incubation with bFGF at 10ng/ml for 2 hrs; the VEGF-treated HMVEC were prepared by incubation with 20ng/ml VEGF for 2 hrs. Following incubation with the respective growth factor, the cells were washed and lysis buffer added for RNA preparation. The GRRpz and WOca cell lines were provided by Dr. Donna M. Peehl, Department of Medicine, Stanford University School of Medicine. GRRpz was derived from normal prostate epithelium. The WOca cell line is a Gleason Grade 4 cell line.

10

Table 1. Description of cDNA Libraries

Library (lib #)	Description	Number of Clones in Library
0	Artificial library composed of deselected clones (clones with no associated variant or cluster)	673
1	Human Colon Cell Line Km12 L4: High Metastatic Potential (derived from Km12C)	308731
2	Human Colon Cell Line Km12C: Low Metastatic Potential	284771
3	Human Breast Cancer Cell Line MDA-MB-231: High Metastatic Potential; micro-mets in lung	326937
4	Human Breast Cancer Cell Line MCF7: Non Metastatic	318979
8	Human Lung Cancer Cell Line MV-522: High Metastatic Potential	223620
9	Human Lung Cancer Cell Line UCP-3: Low Metastatic Potential	312503
12	Human microvascular endothelial cells (HMEC) - UNTREATED (PCR (OligodT) cDNA library)	41938
13	Human microvascular endothelial cells (HMEC) - bFGF TREATED (PCR (OligodT) cDNA library)	42100
14	Human microvascular endothelial cells (HMEC) - VEGF TREATED (PCR (OligodT) cDNA library)	42825
15	Normal Colon - UC#2 Patient (MICRODISSECTED PCR (OligodT) cDNA library)	282722
16	Colon Tumor - UC#2 Patient (MICRODISSECTED PCR (OligodT) cDNA library)	298831
17	Liver Metastasis from Colon Tumor of UC#2 Patient (MICRODISSECTED PCR (OligodT) cDNA library)	303467
18	Normal Colon - UC#3 Patient (MICRODISSECTED PCR (OligodT) cDNA library)	36216
19	Colon Tumor - UC#3 Patient (MICRODISSECTED PCR (OligodT) cDNA library)	41388
20	Liver Metastasis from Colon Tumor of UC#3 Patient (MICRODISSECTED PCR (OligodT) cDNA library)	30956
21	GRRpz Cells derived from normal prostate epithelium	164801
22	WOca Cells derived from Gleason Grade 4 prostate cancer epithelium	162088
23	Normal Lung Epithelium of Patient #1006 (MICRODISSECTED PCR (OligodT) cDNA library)	306198

Library (lib #)	Description	Number of Clones in Library
24	Primary tumor, Large Cell Carcinoma of Patient #1006 (MICRODISSECTED PCR (OligodT) cDNA library)	309349
25	Normal Prostate Epithelium from Patient IF97-26811	279444
26	Prostate Cancer Epithelium Gleason 3+3 Patient IF97-26811	269406
27	Normal Breast Epithelium from Patient 515	239494
28	Primary Breast tumor from Patient 515	259960
29	Lymph node metastasis from Patient 515	326786
30	Normal Prostate Epithelium from Chiron Patient ID 884	298431
31	Prostate Cancer Epithelium (Gleason 4+4) from Chiron Patient ID 884	331941

Characterization of sequences in the libraries

After using the software program Phred (ver 0.000925.c, Green and Weing., ©1993-2000) to select those polynucleotides having the best quality sequence, the polynucleotides were compared against the public databases to identify any homologous sequences. The sequences of the isolated polynucleotides were first masked to eliminate low complexity sequences using the BLASTX masking program (Claverie "Effective Large-Scale Sequence Similarity Searches," In: Computer Methods for Macromolecular Sequence Analysis, Doolittle, ed., Meth. Enzymol. 266:212-227 Academic Press, NY, NY (1996); see particularly Claverie, in "Automated DNA Sequencing and Analysis Techniques" Adams et al., eds., Chap. 36, p. 267 Academic Press, San Diego, 1994 and Claverie et al. Comput. Chem. (1993) 17:191). Generally, masking does not influence the final search results, except to eliminate sequences of relatively little interest due to their low complexity, and to eliminate multiple "hits" based on similarity to repetitive regions common to multiple sequences, e.g., Alu repeats. The remaining sequences were then used in a BLASTN vs. GenBank search; sequences that exhibited greater than 70% overlap, 99% identity, and a p value of less than 1×10^{-40} were discarded. Sequences from this search also were discarded if the inclusive parameters were met, but the sequence was ribosomal or vector-derived.

The resulting sequences from the previous search were classified into three groups (1, 2 and 3 below) and searched in a BLASTX vs. NRP (non-redundant proteins) database search: (1) unknown (no hits in the GenBank search), (2) weak similarity (greater than 45% identity and p value of less than 1×10^{-5}), and (3) high similarity (greater than 60% overlap, greater than 80% identity, and p value less than 1×10^{-5}). Sequences having greater than 70% overlap, greater than 99% identity, and p value of less than 1×10^{-40} were discarded.

The remaining sequences were classified as unknown (no hits), weak similarity, and high similarity (parameters as above). Two searches were performed on these sequences. First, a BLAST vs. EST database search was performed and sequences with greater than 99% overlap, greater than

99% similarity and a p value of less than 1×10^{-40} were discarded. Sequences with a p value of less than 1×10^{-65} when compared to a database sequence of human origin were also excluded. Second, a BLASTN vs. Patent GeneSeq database was performed and sequences having greater than 99% identity, p value less than 1×10^{-40} , and greater than 99% overlap were discarded.

5 The remaining sequences were subjected to screening using other rules and redundancies in the dataset. Sequences with a p value of less than 1×10^{-111} in relation to a database sequence of human origin were specifically excluded. The final result provided the 8064 sequences listed as SEQ ID NOS:1-6010 in the accompanying Sequence Listing and summarized in Table 2 (inserted prior to claims). Each identified polynucleotide represents sequence from at least a partial mRNA transcript.

10 Summary of polynucleotides of the invention

Table 2 (inserted prior to claims) provides a summary of polynucleotides isolated as described. Specifically, Table 2 provides: 1) the SEQ ID NO ("SEQ ID") assigned to each sequence for use in the present specification; 2) the Cluster Identification No. ("CLUSTER"); 3) the Sequence Name assigned to each sequence; 3) the sequence name ("SEQ NAME") used as an internal identifier of the sequence; 4) the orientation of the sequence ("ORIENT") (either forward (F) or reverse (R)); 5) the name assigned to the clone from which the sequence was isolated ("CLONE ID"); and the name of the library from which the sequence was isolated ("LIBRARY"), where the notation indicates that name of the cell line or patient sample (e.g., UC2-NormColon indicates the sequence was isolated from normal colon tissue of the patient assigned the identification UC#2). Because at least some of the provided polynucleotides represent partial mRNA transcripts, two or more polynucleotides may represent different regions of the same mRNA transcript and the same gene and/or may be contained within the same clone. Thus, for example, if two or more SEQ ID NOS: are identified as belonging to the same clone, then either sequence can be used to obtain the full-length mRNA or gene

25 Example 2: Results of Public Database Search to Identify Function of Gene Products

SEQ ID NOS:1-6010 were translated in all three reading frames, and the nucleotide sequences and translated amino acid sequences used as query sequences to search for homologous sequences in either the GenBank (nucleotide sequences) or Non-Redundant Protein (amino acid sequences) databases. Query and individual sequences were aligned using the BLAST 2.0 programs, available over the world wide at a site sponsored by the National Center for Biotechnology Information, which is supported by the National Library of Medicine and the National Institutes of Health (see also Altschul, et al. Nucleic Acids Res. (1997) 25:3389-3402). The sequences were masked to various extents to prevent searching of repetitive sequences or poly-A sequences, using the BLASTX program for masking low complexity as described above in Example 1.

Tables 3A and 3B (inserted prior to claims) provides the alignment summaries having a p value of 1×10^{-2} or less indicating substantial homology between the sequences of the present invention and those of the indicated public databases. Specifically, Table 3A provides the SEQ ID NO of the query sequence, the accession number of the GenBank database entry of the homologous sequence, and the individual p value of each alignment. Table 3A provides the SEQ ID NO of the query sequence, the accession number of the Non-Redundant Protein database entry of the homologous sequence, and the individual p value of each alignment. The alignments provided in Tables 3A and 3B are the best available alignment to a DNA or amino acid sequence at a time just prior to filing of the present specification. The activity of the polypeptide encoded by the SEQ ID NOS listed in these tables can be extrapolated to be substantially the same or substantially similar to the activity of the reported nearest neighbor or closely related sequence. The accession number of the nearest neighbor is reported, providing a publicly available reference to the activities and functions exhibited by the nearest neighbor. The public information regarding the activities and functions of each of the nearest neighbor sequences is incorporated by reference in this application. Also incorporated by reference is all publicly available information regarding the sequence, as well as the putative and actual activities and functions of the nearest neighbor sequences listed in Tables 3A and 3B and their related sequences. The search program and database used for the alignment, as well as the calculation of the p value are also indicated.

Full length sequences or fragments of the polynucleotide sequences of the nearest neighbors can be used as probes and primers to identify and isolate the full length sequence of the corresponding polynucleotide. The nearest neighbors can indicate a tissue or cell type to be used to construct a library for the full-length sequences of the corresponding polynucleotides.

Example 3: Members of Protein Families

SEQ ID NOS:1-6010 were used to conduct a profile search as described in the specification above. Several of the polynucleotides of the invention were found to encode polypeptides having characteristics of a polypeptide belonging to a known protein family (and thus represent members of these protein families) and/or comprising a known functional domain. Table 4 (inserted before claims) provides the SEQ ID NO: of the query sequence, the Sequence Name, the Cluster to which the sequence is assigned, a brief description of the profile hit, the orientation (Direction, "Dir") of the query sequence with respect to the individual sequence)where forward (for) indicates that the alignment is in the same direction (left to right) as the sequence provided in the Sequence Listing and reverse (rev) indicates that the alignment is with a sequence complementary to the sequence provided in the Sequence Listing), and the score of the profile hit.

Some polynucleotides exhibited multiple profile hits where the query sequence contains overlapping profile regions, and/or where the sequence contains two different functional domains. Each of the profile hits of Table 4 is described in more detail below. The acronyms for the profiles (provided in parentheses) are those used to identify the profile in the Pfam, Prosite, and InterPro databases. The Pfam database can be accessed through web sites supported by Genome Sequencing Center at the Washington University School of Medicine or by the European Molecular Biology Laboratories in Heidelberg, Germany. The Prosite database can be accessed at the ExPASy Molecular Biology Server on the internet. The InterPro database can be accessed at a web site supported by the EMBL European Bioinformatics Institute. The public information available on the Pfam, Prosite, and InterPro databases regarding the various profiles, including but not limited to the activities, function, and consensus sequences of various proteins families and protein domains, is incorporated herein by reference.

Seven Transmembrane Integral Membrane Proteins -- Rhodopsin Family (7tm 1; Pfam Accession No. PF00001). SEQ ID NOS:2973, 5467, and 5508 correspond to sequences encoding a polypeptides that are members of the seven transmembrane (7tm) receptor rhodopsin family. G-protein coupled receptors of the (7tm) rhodopsin family (also called R7G) are an extensive group of hormones, neurotransmitters, and light receptors which transduce extracellular signals by interaction with guanine nucleotide-binding (G) proteins (Strosberg, Eur. J. Biochem. (1991) 196:1; Kerlavage, Curr. Opin. Struct. Biol. (1991) 1:394; Probst et al., DNA Cell Biol. (1992) 11:1; Savarese et al., Biochem. J. (1992) 283:1. The consensus pattern that contains the conserved triplet and that also spans the major part of the third transmembrane helix is used to detect this widespread family of proteins: [GSTALIVMFYWC]-[GSTANCPDE]-{EDPKRH}-x(2)-[LIVMNQGA]-x(2)-[LIVMFT]-[GSTANC]-[LIVMFYWSTAC]-[DENH]-R-[FYWCSH]-x(2)-[LIVM].

Ank Repeats (ANK; Pfam Accession No. PF0023). SEQ ID NOS:445, 487 and 3013 represent polynucleotides encoding Ank repeat-containing proteins. The ankyrin motif is a 33 amino acid sequence named after the protein ankyrin which has 24 tandem 33-amino-acid motifs. Ank repeats were originally identified in the cell-cycle-control protein cdc10 (Breedon et al., Nature (1987) 329:651). Proteins containing ankyrin repeats include ankyrin, myotropin, I-kappaB proteins, cell cycle protein cdc10, the Notch receptor (Matsumo et al., Development (1997) 124(21):4265); G9a (or BAT8) of the class III region of the major histocompatibility complex (Biochem J. (1993) 290:811-818); FABP, GABP, 53BP2, Lin12, glp-1, SW14, and SW16. The functions of the ankyrin repeats are compatible with a role in protein-protein interactions (Bork, Proteins (1993) 17(4):363; Lambert and Bennet, Eur. J. Biochem. (1993) 211:1; Kerr et al., Current Op. Cell Biol. (1992) 4:496; Bennet et al., J. Biol. Chem. (1980) 255:6424).

Basic Region Plus Leucine Zipper Transcription Factors (BZIP; Pfam Accession

No. PF00170. SEQ ID NOS:108, 1714, 3931, and 4356 represent polynucleotides encoding novel members of the family of basic region plus leucine zipper transcription factors. The bZIP superfamily (Hurst, *Protein Prof.* (1995) 2:105; and Ellenberger, *Curr. Opin. Struct. Biol.* (1994) 4:12) of eukaryotic DNA-binding transcription factors encompasses proteins that contain a basic region mediating sequence-specific DNA-binding followed by a leucine zipper required for dimerization. The consensus pattern for this protein family is: [KR]-x(1,3)-[RKSAQ]-N-x(2)-[SAQ](2)-x-[RKTAENQ]-x-R-x-[RK].

DEAD and DEAH box families ATP-dependent helicases (Dead_box_helic; Pfam Accession

No. PF00270. SEQ ID NOS:38, 415, and 5756 correspond to sequences encoding a polypeptides that are members of the DEAD box family. A number of eukaryotic and prokaryotic proteins have been characterized (Schmid *et al.*, *Mol. Microbiol.* (1992) 6:283; Linder *et al.*, *Nature* (1989) 337:121; Wassarman *et al.*, *Nature* (1991) 349:463) on the basis of their structural similarity. All are involved in ATP-dependent, nucleic-acid unwinding. All DEAD box family members of the above proteins share a number of conserved sequence motifs, some of which are specific to the DEAD family while others are shared by other ATP-binding proteins or by proteins belonging to the helicases 'superfamily' (Hodgman, *Nature* (1988) 333:22 and *Nature* (1988) 333:578 (Errata)). One of these motifs, called the 'D-E-A-D-box', represents a special version of the B motif of ATP-binding proteins. Some other proteins belong to a subfamily which have His instead of the second Asp and are thus said to be 'D-E-A-H-box' proteins (Wassarman *et al.*, *Nature* (1991) 349:463; Harosh *et al.*, *Nucleic Acids Res.* (1991) 19:6331; Koonin *et al.*, *J. Gen. Virol.* (1992) 73:989). The following signature patterns are used to identify member for both subfamilies: 1) [LIVMF](2)-D-E-A-D-[RKEN]-x-[LIVMFYGSTN]; and 2) [GSAH]-x-[LIVMF](3)-D-E-[ALIV]-H-[NECR].

Defensins (defensins; Pfam Accession No. PF00323. SEQ ID NO:486 corresponds to a

sequence encoding a polypeptide that is a member of the mammalian defensin family. Defensins are a family of structurally related cysteine-rich peptides which are active against many Gram-positive bacteria, fungi, and enveloped viruses (Lehrer *et al.*, *ASM News* (1990) 56:315-318; Lehrer *et al.*, *Cell* (1991) 64:229-230; Kagan *et al.*, *Toxicology* (1994) 87:131-149; Lehrer *et al.*, *Annu. Rev. Immunol.* (1993) 11:105-128; White *et al.*, *Curr. Opin. Struct. Biol.* (1995) 5:521-527). Some defensins inhibit corticotropoid-stimulated corticosteroid production and also play a significant role in innate immunity to infection and neoplasia. The peptides known to belong to this family range in length from 29 to 35 amino acids and have seven invariant residues, including six cysteines that are all involved in intrachain disulfide bonds. The following consensus pattern is used to identify members of this protein family: C-x-C-x(3,5)-C-x(7)-G-x-C-x(9)-C-C.

EF Hand (Efhand; Pfam Accession No. PF00036). SEQ ID NO:4373 corresponds to a polynucleotide encoding a member of the EF-hand protein family, a calcium binding domain shared by many calcium-binding proteins belonging to the same evolutionary family (Kawasaki *et al.*, *Protein. Prof.* (1995) 2:305-490). The domain is a twelve residue loop flanked on both sides by a twelve residue alpha-helical domain, with a calcium ion coordinated in a pentagonal bipyramidal configuration. The six residues involved in the binding are in positions 1, 3, 5, 7, 9 and 12; these residues are denoted by X, Y, Z, -Y, -X and -Z. The invariant Glu or Asp at position 12 provides two oxygens for liganding Ca (bidentate ligand). The consensus pattern includes the complete EF-hand loop as well as the first residue which follows the loop and which seem to always be hydrophobic: D-x-[DNS]-{ILVIFYW}-[DENSTG]-[DNQGHRK]-{GP}-[LIVMC]-[DENQSTAGC]-x(2)-[DE]-[LIVMIFYW].

Epidermal Growth Factor (EGF; Pfam Accession No. PF00008). SEQ ID NO:3689 represents a polynucleotide encoding a member of the EGF family of proteins. The distinguishing characteristic of this family is the presence of a sequence of about thirty to forty amino acid residues found in epidermal growth factor (EGF) which has been shown to be present, in a more or less conserved form, in a large number of other proteins (Davis, *New Biol.* (1990) 2:410-419; Blomquist *et al.*, *Proc. Natl. Acad. Sci. U.S.A.* (1984) 81:7363-7367; Barkert *et al.*, *Protein Nucl. Acid Enz.* (1986) 29:54-86; Doolittle *et al.*, *Nature.* (1984) 307:558-560; Appella *et al.*, *FEBS Lett.* (1988) 231:1-4; Campbell and Bork, *Curr. Opin. Struct. Biol.* (1993) 3:385-392). A common feature of the domain is that the conserved pattern is generally found in the extracellular domain of membrane-bound proteins or in proteins known to be secreted. The EGF domain includes six cysteine residues which have been shown to be involved in disulfide bonds. The main structure is a two-stranded beta-sheet followed by a loop to a C-terminal short two-stranded sheet. Subdomains between the conserved cysteines strongly vary in length. The following consensus patterns are used to identify members of this family: C-x-C-x(5)-G-x(2)-C and C-x-C-x(s)-[GP]-[FYW]-x(4,8)-C.

Ets Domain (Ets Cterm; Pfam Accession No. PF00178). SEQ ID NO:6 represents a polynucleotide encoding a polypeptide with C-terminal homology in the ETS domain. Proteins of this family contain a conserved domain, the "ETS-domain," that is involved in DNA binding. The domain appears to recognize purine-rich sequences; it is about 85 to 90 amino acids in length, and is rich in aromatic and positively charged residues (Wasylyk *et al.*, *Eur. J. Biochem.* (1993) 211:718). The *ets* gene family encodes a novel class of DNA-binding proteins, each of which binds a specific DNA sequence and comprises an *ets* domain that specifically interacts with sequences containing the common core tri-nucleotide sequence GGA. In addition to an *ets* domain, native *ets* proteins comprise other sequences which can modulate the biological specificity of the protein. *Ets* genes and proteins

are involved in a variety of essential biological processes including cell growth, differentiation and development, and three members are implicated in oncogenic process.

Pleckstrin Homology (PH: Pfam Accession No. PF00169). SEQ ID NOS:228 and 6001 correspond to polynucleotides encoding members of the PH family. The pleckstrin homology domain is a domain of about 100 residues that occurs in a wide range of proteins involved in intracellular signaling or as constituents of the cytoskeleton (Mayer *et al.*, *Cell* (1993) 73:629-630; Haslam *et al.*, *Nature* (1993) 363:309-310; Musacchio *et al.*, *Trends Biochem. Sci.* (1993) 18:343-348; Gibson *et al.*, *Trends Biochem. Sci.* (1994) 19:349-353; Pawson, *Nature* (1995) 373:573-580; Ingley and Hemmings, *J. Cell. Biochem.* (1994) 56:436-443; Saraste and Hyvonen, *Curr. Opin. Struct. Biol.* (1995) 5:403-408). All known structures of PH domains have two perpendicular anti-parallel beta sheets, followed by a C-terminal amphipathic helix. The loops connecting the beta-strands differ greatly in length, making the PH domain relatively difficult to detect (Riddihough, *Nat. Struct. Biol.* (1994) 1:755-757). There are no totally invariant residues within this domain.

Protein Kinase (protkinase: Pfam Accession No. PF00069). SEQ ID NOS:9, 39, 69, 118, 229 and 4151 represent polynucleotides encoding protein kinases, which catalyze phosphorylation of proteins in a variety of pathways, and are implicated in cancer. Eukaryotic protein kinases (Hanks *et al.*, *FASEB J.* (1995) 9:576; Hunter, *Meth. Enzymol.* (1991) 200:3; Hanks *et al.*, *Meth. Enzymol.* (1991) 200:38; Hanks, *Curr. Opin. Struct. Biol.* (1991) 1:369; Hanks *et al.*, *Science* (1988) 241:42) belong to a very extensive family of proteins that share a conserved catalytic core common to both serine/threonine and tyrosine protein kinases. There are a number of conserved regions in the catalytic domain of protein kinases. The first region, located in the N-terminal extremity of the catalytic domain, is a glycine-rich stretch of residues in the vicinity of a lysine residue, which has been shown to be involved in ATP binding. The second region, located in the central part of the catalytic domain, contains a conserved aspartic acid residue that is important for the catalytic activity of the enzyme (Knighton *et al.*, *Science* (1991) 253:407).

The protein kinase profile includes two signature patterns for this second region: one specific for serine/threonine kinases and the other for tyrosine kinases. A third profile is based on the alignment in Hanks *et al.* (*FASEB J.* (1995) 9:576) and covers the entire catalytic domain. The consensus patterns are as follows: 1) [LIV]-G-{P}-G-{P}-[FYWMGSTNH]-[SGA]-{PW}-[LIVCAT]-{PD}-x-[GSTACLIVMFY]-x(5,18)-[LIVMFYWCSTAR]-[AIVP]-[LIVMFAGCKR]-K, where K binds ATP; 2) [LIVMFYC]-x-[HY]-x-D-[LIVMFY]-K-x(2)-N-[LIVMFYCT](3), where D is an active site residue; and 3) [LIVMFYC]-x-[HY]-x-D-[LIVMFY]-[RSTAC]-x(2)-N-[LIVMFYC], where D is an active site residue.

Retroviral aspartyl protease (RVP: Pfam Accession No. PF00077). SEQ ID NO:2038

corresponds to a polynucleotide encoding a member of the Aspartyl Protease family. Aspartyl proteases, also known as acid proteases, are a widely distributed family of proteolytic enzymes known to exist in vertebrates, fungi, plants, retroviruses and some plant viruses (Foltmann, *Essays Biochem.*

- 5 (1981) 17:52-84; Davies, *Annu. Rev. Biophys. Chem.* (1990) 19:189-215; Rao *et al.*, *Biochemistry* (1991) 30:4663-4671). Most retroviral aspartyl proteases (RVP) are homodimers of a chain of about 95 to 125 amino acids. In most retroviruses, the protease is encoded as a segment of a polyprotein which is cleaved during the maturation process of the virus. RVP is generally part of the polypeptide and, more rarely, of the gag polyprotein. The consensus pattern is as follows:
- 10 [LIVMFGAC]-[LIVMTADN]-[LIVFSA]-D-[ST]-G-[STAV]-[STAPDENQ]-x-[LIVMFSTNC]-x-[LIVMFGTA] [D is the active site residue].

Reverse Transcriptase (rvt: Pfam Accession No. PF00078). SEQ ID NOS:1511 and 2514

represent polynucleotides encoding reverse transcriptases, which occur in a variety of mobile elements, including retrotransposons, retroviruses, group II introns, bacterial msDNAs, hepadnaviruses, and caulimoviruses (Xiong and Eickbush, *EMBO J* (1990) 9:3353-3362). Reverse transcriptases catalyze

15 RNA-template-directed extension of the 3'-end of a DNA strand by one deoxynucleotide at a time and require an RNA or DNA primer.

Transforming growth factor beta like domain (TGF_beta: Pfam Accession No. PF00019).

SEQ ID NO:5522 represents a polynucleotide encoding a polypeptide of the TGF-beta family.

- 20 Proteins from the transforming growth factor-beta family are active as homo- or hetero-dimers with the two chains being linked by a single disulfide bond (Roberts and Sporn, *In Peptide growth factors and their receptors*, Handbook of Experimental Pharmacology, Vol. 95, pp419-475, Springer Verlag, Heidelberg, (1990); Burt, *Biochem. Biophys. Res. Commun.* (1992) 184:590-595; Burt and Law, *Prog. Growth Factor Res.* (1994) 5:99-118). It is known from X-ray studies that all the other
- 25 cysteines of the sequence are involved in interchain disulfide bonds (Daopin *et al.*, *Science* (1992) 257:369-373). Members of this family can be recognized by the following consensus pattern: [LIVM]-x(2)-P-x(2)-[FY]-x(4)-C-x-G-x-C (The two C's are involved in disulfide bonds).

WD Domain (WD40), G-Beta Repeats (WD domain: Pfam Accession No. PF00400). SEQ

ID NO:117 represents a member of the WD domain/G-beta repeat family. Beta-transducin (G-beta) is

30 one of the three subunits (alpha, beta, and gamma) of the guanine nucleotide-binding proteins (G proteins) which act as intermediaries in the transduction of signals generated by transmembrane receptors (Gilman, *Annu. Rev. Biochem.* (1987) 56:615). The alpha subunit binds to and hydrolyzes GTP; the beta and gamma subunits are required for the replacement of GDP by GTP as well as for membrane anchoring and receptor recognition. In higher eukaryotes, G-beta exists as a small

multigene family of highly conserved proteins of about 340 amino acid residues. Structurally, G-beta has eight tandem repeats of about 40 residues, each containing a central Trp-Asp motif (this type of repeat is sometimes called a WD-40 repeat). The consensus pattern for the WD domain/G-Beta repeat family is: [LIVMSTAC]-[LIVMFYWSTAGC]-[LIMSTAG]-[LIVMSTAGC]-x(2)-[DN]-x(2)-

5 [LIVMWSTAC]-x-[LIVMFSTAG]-W-[DEN]-[LIVMFSTAGCN].

Zinc Finger, C2H2 Type (Zincfing_C2H2; Pfam Accession No. PF00096). SEQ ID NOS: 61, 502, 700, 847, 2034, 2054, 3403, 3524, 3653, 3723, 4688, and 4979 correspond to polynucleotides encoding members of the C2H2 type zinc finger protein family, which contain zinc finger domains that facilitate nucleic acid binding (Klug *et al.*, *Trends Biochem. Sci.* (1987) 12:464; Evans *et al.*, *Cell* (1988) 52:1; Payre *et al.*, *FEBS Lett.* (1988) 234:245; Miller *et al.*, *EMBO J.* (1985) 4:1609; and Berg, *Proc. Natl. Acad. Sci. USA* (1988) 85:99). In addition to the conserved zinc ligand residues, a number of other positions are also important for the structural integrity of the C2H2 zinc fingers (Rosenfeld *et al.*, *J. Biomol. Struct. Dyn.* (1993) 11:557). The best conserved position, which is generally an aromatic or aliphatic residue, is located four residues after the second cysteine. The consensus pattern for C2H2 zinc fingers is: C-x(2,4)-C-x(3)-[LIVMFYWC]-x(8)-H-x(3,5)-H. The two C's and two H's are zinc ligands.

Zinc Finger, C2HC Type (Zincfing_C2HC; Pfam Accession No. PF01530). SEQ ID NO:3814 represents a member of the C2HC zinc finger family. The 18 residue C2HC domain is mainly found in the retroviral nucleocapsid protein, and is required for viral genome packaging and for the early infection process (Katz and Jentoft, *Bioessays* (1989) 11:176-181; Urbaneja *et al.*, *J Mol Biol.* (1999) 287:59-75). In addition, the CCHC domain is found in eukaryotic proteins involved in RNA binding or single-strand DNA binding.

Zinc finger, C3HC4 type (RING finger), signature (Zincfing_C3HC4; Pfam Accession No. PF00097). SEQ ID NO:3140 represents a polynucleotide encoding a polypeptide having a C3HC4 type zinc finger signature. A number of eukaryotic and viral proteins contain this signature, which is primarily a conserved cysteine-rich domain of 40 to 60 residues (Borden *et al.*, *Curr. Opin. Struct. Biol.* (1996) 6:395) that binds two atoms of zinc, and is probably involved in mediating protein-protein interactions. The 3D structure of the zinc ligation system is unique to the RING domain and is referred to as the "cross-brace" motif. The spacing of the cysteines in such a domain is C-x(2)-C-x(9 to 39)-C-x(1 to 3)-H-x(2 to 3)-C-x(2)-C-x(4 to 48)-C-x(2)-C. The signature pattern for the C3HC4 finger is based on the domain's central region: C-x-H-x-[LIVMFY]-C-x(2)-C-[LIVMYA].

Zinc finger, CCCH type, (Zincfing_CCCH; Pfam Accession No. PF00642). SEQ ID NO:877 corresponds to a polynucleotide encoding a member of the CCCH zinc finger protein family. This domain is present in many eukaryotic proteins, including zinc finger proteins involved in cell cycle or

growth phase-related regulation and regulatory proteins involved in regulating the response to growth factors. It has been shown that proteins containing the CCCH zinc finger interact with the 3' untranslated region of various mRNA (Carballo *et al.*, *Science* (1998) 281:1001-1005; Lai *et al.*, *Mol. Cell. Biol.* (1999) 19:4311-4323) and that this domain is often present in two copies. The consensus
 5 pattern for the CCCH zinc fingers is: C-x8-C-x5-C-x3-H.

Example 4: Description of Libraries and Detection of Differential Expression

The relative expression levels of the polynucleotides of the invention were assessed in several libraries prepared from various sources, including cell lines and patient tissue samples. Table 1 above
 10 provides a summary of these libraries, including the shortened library name, the mRNA source used to prepared the cDNA library, the "nickname" of the library that is used in the tables below (in quotes), and the approximate number of clones in the library.

Each of the libraries is composed of a collection of cDNA clones that in turn are representative of the mRNAs expressed in the indicated mRNA source. In order to facilitate the analysis of the
 15 millions of sequences in each library, the sequences were assigned to clusters. The concept of "cluster of clones" is derived from a sorting/grouping of cDNA clones based on their hybridization pattern to a panel of roughly 300 7bp oligonucleotide probes (see Drmanac *et al.*, *Genomics* (1996) 37(1):29). Random cDNA clones from a tissue library are hybridized at moderate stringency to 300 7bp oligonucleotides. Each oligonucleotide has some measure of specific hybridization to that specific
 20 clone. The combination of 300 of these measures of hybridization for 300 probes equals the "hybridization signature" for a specific clone. Clones with similar sequence will have similar hybridization signatures. By developing a sorting/grouping algorithm to analyze these signatures, groups of clones in a library can be identified and brought together computationally. These groups of clones are termed "clusters". Depending on the stringency of the selection in the algorithm (similar to
 25 the stringency of hybridization in a classic library cDNA screening protocol), the "purity" of each cluster can be controlled. For example, artifacts of clustering may occur in computational clustering just as artifacts can occur in "wet-lab" screening of a cDNA library with 400 bp cDNA fragments, at even the highest stringency. The stringency used in the implementation of cluster herein provides groups of clones that are in general from the same cDNA or closely related cDNAs. Closely related
 30 clones can be a result of different length clones of the same cDNA, closely related clones from highly related gene families, or splice variants of the same cDNA.

Differential expression for a selected cluster was assessed by first determining the number of cDNA clones corresponding to the selected cluster in the first library (Clones in 1st), and the determining the number of cDNA clones corresponding to the selected cluster in the second library

(Clones in 2nd). Differential expression of the selected cluster in the first library relative to the second library is expressed as a "ratio" of percent expression between the two libraries. In general, the "ratio" is calculated by: 1) calculating the percent expression of the selected cluster in the first library by dividing the number of clones corresponding to a selected cluster in the first library by the total number of clones analyzed from the first library; 2) calculating the percent expression of the selected cluster in the second library by dividing the number of clones corresponding to a selected cluster in a second library by the total number of clones analyzed from the second library; 3) dividing the calculated percent expression from the first library by the calculated percent expression from the second library. If the "number of clones" corresponding to a selected cluster in a library is zero, the value is set at 1 to aid in calculation. The formula used in calculating the ratio takes into account the "depth" of each of the libraries being compared, *i.e.*, the total number of clones analyzed in each library.

In general, a polynucleotide is significantly differentially expressed between two samples when the ratio value is greater than at least about 2, preferably greater than at least about 3, more preferably greater than at least about 5, where the ratio value is calculated using the method described above.

The significance of differential expression is determined using a z score test (Zar, Biostatistical Analysis, Prentice Hall, Inc., USA, "Differences Between Proportions," pp 296-298 (1974)).

Using this approach, a number of polynucleotide sequences were identified as being differentially expressed between, for example, cells derived from high metastatic potential cancer tissue and low metastatic cancer cells, and between cells derived from metastatic cancer tissue and normal tissue. Evaluation of the levels of expression of the genes corresponding to these sequences can be valuable in diagnosis, prognosis, and/or treatment (*e.g.*, to facilitate rationale design of therapy, monitoring during and after therapy, *etc.*). Moreover, the genes corresponding to differentially expressed sequences described herein can be therapeutic targets due to their involvement in regulation (*e.g.*, inhibition or promotion) of development of, for example, the metastatic phenotype. For example, sequences that correspond to genes that are increased in expression in high metastatic potential cells relative to normal or non-metastatic tumor cells may encode genes or regulatory sequences involved in processes such as angiogenesis, differentiation, cell replication, and metastasis.

Detection of the relative expression levels of differentially expressed polynucleotides described herein can provide valuable information to guide the clinician in the choice of therapy. For example, a patient sample exhibiting an expression level of one or more of these polynucleotides that corresponds to a gene that is increased in expression in metastatic or high metastatic potential cells may warrant more aggressive treatment for the patient. In contrast, detection of expression levels of a polynucleotide sequence that corresponds to expression levels associated with that of low metastatic potential cells may warrant a more positive prognosis than the gross pathology would suggest.

A number of polynucleotide sequences of the present invention are differentially expressed between human microvascular endothelial cells (HMVEC) that have been treated with growth factors relative to untreated HMVEC. Sequences that are differentially expressed between growth factor-treated HMVEC and untreated HMVEC can represent sequences encoding gene products involved in angiogenesis, metastasis (cell migration), and other development and oncogenic processes. For example, sequences that are more highly expressed in HMVEC treated with growth factors (such as bFGF or VEGF) relative to untreated HMVEC can serve as drug targets for chemotherapeutics, *e.g.*, decreasing expression of such up-regulated genes or inhibiting the activity of the encoded gene product would serve to inhibit tumor cell angiogenesis. Detection of expression of these sequences in colon cancer tissue can be valuable in determining diagnostic, prognostic and/or treatment information associated with the prevention of achieving the malignant state in these tissues, and can be important in risk assessment for a patient. A patient sample displaying an increased level of one or more of these polynucleotides may thus warrant closer attention or more frequent screening procedures to catch the malignant state as early as possible.

The differential expression of the polynucleotides can thus be used as, for example, diagnostic and/or prognostic markers, for risk assessment, patient treatment and the like. These polynucleotides can also be used in combination with other molecular and/or biochemical markers.

The differential expression data for polynucleotides of the invention that have been identified as being differentially expressed across various combinations of the libraries described above is summarized in Table 5 (inserted prior to the claims). Table 5 provides: 1) the Sequence Identification Number ("SEQ ID NO") assigned to the polynucleotide; 2) the cluster ("CLUSTER") to which the polynucleotide has been assigned as described above; 3) the library comparisons that resulted in identification of the polynucleotide as being differentially expressed ("PAIR AB"), where the cDNA libraries used are referenced by their library numbers; 4) the number of clones corresponding to the polynucleotide in the first library listed ("CLONES A"); 5) the number of clones corresponding to the polynucleotide in the second library listed ("CLONES B"); 6) the "RATIO PLUS" where the comparison resulted in a finding that the number of clones in library A is greater than the number of clones in library B; and 7) the "RATIO MINUS" where the comparison resulted in a finding that the number of clones in library B is greater than the number of clones in library A.

Detection of expression of genes that correspond to the above polynucleotides may be of particular interest in diagnosis, prognosis, risk assessment, and monitoring of treatment. Furthermore, differential expression of a specific gene across multiple libraries can also be indicative of a gene whose expression is associated with, for example, suppression of the metastatic phenotype or with development of the cell toward a metastatic phenotype. For example, SEQ ID NO:3744 corresponds

to a gene that is expressed at relatively higher levels in metastatized colon tumor than in normal colon tissue. Thus a relatively increased level of expression of the gene corresponding to SEQ ID NO:3744 may be used as marker of a metastatic or pre-metastatic colon cels either alone or in combination with other markers.

- 5 Some polynucleotides exhibited similar differential expression trends in libraries of different tissue origin (see, *e.g.*, SEQ ID NO:337). These data suggest that the differential expression patterns of some genes associated with development of tumors indicate a role for those genes that is non-specific to the tissue of origin.

10 Example 5: Detection of Differential Expression Using Arrays

- mRNA isolated from samples of cancerous and normal colon tissue obtained from patients were analyzed to identify genes differentially expressed in cancerous and normal cells. Normal and cancerous cells collected from cryopreserved patient tissues were isolated using laser capture microdissection (LCM) techniques, which techniques are well known in the art (see, *e.g.*, Ohyama *et al.* (2000) *Biotechniques* 29:530-6; Curran *et al.* (2000) *Mol. Pathol.* 53:64-8; Suarez-Quian *et al.* 15 (1999) *Biotechniques* 26:328-35; Simone *et al.* (1998) *Trends Genet* 14:272-6; Conia *et al.* (1997) *J. Clin. Lab. Anal.* 11:28-38; Emmert-Buck *et al.* (1996) *Science* 274:998-1001).

- Table 6 (inserted before the claims) provides information about each patient from which colon tissue samples were isolated, including: the Patient ID ("PT ID") and Path ReportID ({Path ID}), which 20 are numbers assigned to the patient and the pathology reports for identification purposes; the group ("Grp") to which the patients have been assigned; the anatomical location of the tumor ("Anatom Loc"); the primary tumor size ("Size"); the primary tumor grade ("Grade"); the identification of the histopathological grade ("Histo Grade"); a description of local sites to which the tumor had invaded ("Local Invasion"); the presence of lymph node metastases ("LN Met"); the incidence of lymph node 25 metastases (provided as a number of lymph nodes positive for metastasis over the number of lymph nodes examined) ("Incidence Lymphnode Met"); the "Regional Lymphnode Grade"; the identification or detection of metastases to sites distant to the tumor and their location ("Dist Met & Loc"); the grade of distant metastasis ("Dist Met Grade"); and general comments about the patient or the tumor ("Comments"). Histopathology of all primary tumors incicated the tumor was adenocarcinmoa except 30 for Patient ID Nos. 130 (for which no information was provided), 392 (in which greater than 50% of the cells were mucinous carcinoma), and 784 (adenosquamous carcinoma). Extranodal extensions were described in three patients, Patient ID Nos. 784, 789, and 791. Lymphovascular invasion was described in Patient ID Nos. 128, 278, 517, 534, 784, 786, 789, 791, 890, and 892. Crohn's-like

infiltrates were described in seven patients, Patient ID Nos. 52, 264, 268, 392, 393, 784, and 791.

Table 7 (below) provides information about the patients from whom the prostate tissue was isolated.

Table 7. Prostate patient data.

Prostate Patient ID	Tumor Gleason Grade	Normal Prostate Description
96	3+3 Adenocarcinoma	Normal prostate; Benign hyperplasia
282	4+3 Adenocarcinoma	Normal prostate; Benign hyperplasia
286	3+3 Adenocarcinoma	Normal prostate; Benign hyperplasia
294	3+4 Adenocarcinoma	Normal prostate; Benign hyperplasia
362	3+3 Adenocarcinoma	Normal prostate; Benign hyperplasia
428	4+3 Adenocarcinoma	Normal prostate; Benign hyperplasia
492	3+3 Adenocarcinoma	Normal prostate; Benign hyperplasia
492	3+3 Adenocarcinoma	Normal prostate; Benign hyperplasia
493	3+4 Adenocarcinoma	Normal prostate; Benign hyperplasia
510	3+3 Adenocarcinoma	Normal Prostate; Benign hyperplasia

5 Identification of differentially expressed genes

cDNA probes were prepared from total RNA isolated from the patient cells described above. Since LCM provides for the isolation of specific cell types to provide a substantially homogenous cell sample, this provided for a similarly pure RNA sample.

Total RNA was first reverse transcribed into cDNA using a primer containing a T7 RNA
 10 polymerase promoter, followed by second strand DNA synthesis. cDNA was then transcribed *in vitro* to produce antisense RNA using the T7 promoter-mediated expression (see, *e.g.*, Luo *et al.* (1999) *Nature Med* 5:117-122), and the antisense RNA was then converted into cDNA. The second set of cDNAs were again transcribed *in vitro*, using the T7 promoter, to provide antisense RNA. Optionally, the RNA was again converted into cDNA, allowing for up to a third round of T7-mediated
 15 amplification to produce more antisense RNA. Thus the procedure provided for two or three rounds of *in vitro* transcription to produce the final RNA used for fluorescent labeling.

Fluorescent probes were generated by first adding control RNA to the antisense RNA mix, and producing fluorescently labeled cDNA from the RNA starting material. Fluorescently labeled cDNAs prepared from the tumor RNA sample were compared to fluorescently labeled cDNAs prepared from
 20 normal cell RNA sample. For example, the cDNA probes from the normal cells were labeled with Cy3 fluorescent dye (green) and the cDNA probes prepared from the tumor cells were labeled with Cy5 fluorescent dye (red), and vice versa.

Each array used had an identical spatial layout and control spot set. Each microarray was divided into two areas, each area having an array with, on each half, twelve groupings of 32 x 12 spots,
 25 for a total of about 9,216 spots on each array. The two areas are spotted identically which provide for at least two duplicates of each clone per array.

Polynucleotides for use on the arrays were obtained from both publicly available sources and from cDNA libraries generated from selected cell lines and patient tissues. PCR products of from about 0.5kb to 2.0 kb amplified from these sources were spotted onto the array using a Molecular Dynamics Gen III spotter according to the manufacturer's recommendations. For polynucleotides described herein, the microarray spot contained a clone having a cDNA from which the sequence was derived. The first row of each of the 24 regions on the array had about 32 control spots, including 4 negative control spots and 8 test polynucleotides. The test polynucleotides were spiked into each sample before the labeling reaction with a range of concentrations from 2-600 pg/slide and ratios of 1:1. For each array design, two slides were hybridized with the test samples reverse-labeled in the labeling reaction. This provided for about four duplicate measurements for each clone, two of one color and two of the other, for each sample.

Table 8 (inserted before the claims) describes sequences present on the arrays. Table 8 includes: 1) the SEQ ID NO of the sequence of the polynucleotide; and 2) the Spot ID, which is a unique identifier for each spot containing target sequence of interest on all arrays used.

The differential expression assay was performed by mixing equal amounts of probes from tumor cells and normal cells of the same patient. The arrays were prehybridized by incubation for about 2 hrs at 60°C in 5X SSC/0.2% SDS/1 mM EDTA, and then washed three times in water and twice in isopropanol. Following prehybridization of the array, the probe mixture was then hybridized to the array under conditions of high stringency (overnight at 42°C in 50% formamide, 5X SSC, and 0.2% SDS. After hybridization, the array was washed at 55°C three times as follows: 1) first wash in 1X SSC/0.2% SDS; 2) second wash in 0.1X SSC/0.2% SDS; and 3) third wash in 0.1X SSC.

The arrays were then scanned for green and red fluorescence using a Molecular Dynamics Generation III dual color laser-scanner/detector. The images were processed using BioDiscovery Autogene software, and the data from each scan set normalized to provide for a ratio of expression relative to normal. Data from the microarray experiments was analyzed according to the algorithms described in U.S. application serial no. 60/252,358, filed November 20, 2000, by E.J. Moler, M.A. Boyle, and F.M. Randazzo, and entitled "Precision and accuracy in cDNA microarray data," which application is specifically incorporated herein by reference.

The experiment was repeated, this time labeling the two probes with the opposite color in order to perform the assay in both "color directions." Each experiment was sometimes repeated with two more slides (one in each color direction). The level fluorescence for each sequence on the array expressed as a ratio of the geometric mean of 8 replicate spots/genes from the four arrays or 4 replicate spots/gene from 2 arrays or some other permutation. The data were normalized using the spiked positive controls present in each duplicated area, and the precision of this normalization was included

in the final determination of the significance of each differential. The fluorescent intensity of each spot was also compared to the negative controls in each duplicated area to determine which spots have detected significant expression levels in each sample.

A statistical analysis of the fluorescent intensities was applied to each set of duplicate spots to assess the precision and significance of each differential measurement, resulting in a p-value testing the null hypothesis that there is no differential in the expression level between the tumor and normal samples of each patient. During initial analysis of the microarrays, the hypothesis was accepted if $p > 10^{-3}$, and the differential ratio was set to 1.000 for those spots. All other spots have a significant difference in expression between the tumor and normal sample. If the tumor sample has detectable expression and the normal does not, the ratio is truncated at 1000 since the value for expression in the normal sample would be zero, and the ratio would not be a mathematically useful value (e.g., infinity). If the normal sample has detectable expression and the tumor does not, the ratio is truncated to 0.001, since the value for expression in the tumor sample would be zero and the ratio would not be a mathematically useful value. These latter two situations are referred to herein as "on/off." Database tables were populated using a 95% confidence level ($p > 0.05$).

Table 8 (inserted before the claims) provides the results for gene products differentially expressed in the colon tumor samples relative to normal tissue samples. Table 8 includes: 1) the SEQ ID NO; 2) the spot identification number ("SpotID"); 3) the percentage of patients tested in which expression levels of the gene (as detected using the corresponding clone) was at least 2-fold greater in cancerous colon tissue (primary colon tumor) than in matched normal tissue ("Colon > 2x T/N"); 4) the percentage of patients tested in which expression levels of the gene was less than or equal to one-half of the expression level in matched normal cells ("Colon ≤ 1/2 T/N"); and 5) the colon number ratios, indicating the number of patients upon which the provided ratios was based.

Table 9 below provides the data for differential expression analysis on the arrays using samples from metastasized colon tissue. In this example, the samples used for hybridization to sequences on the microarray were derived from the matched metastasized (MT) colon tissue and normal (N) colon tissues of the patients. Table 9 includes: 1) the SEQ ID NO; 2) the percentage of patients tested in which expression levels of the gene (as detected using the corresponding clone) was at least 2-fold greater in metastasized cancerous colon tissue (MT) than in matched normal tissue ("Colon > 2x MT/N"); 5) the percentage of patients tested in which expression levels of the gene was less than or equal to one-half of the expression level in matched normal cells ("Colon ≤ 1/2 T/N"); and 8) the colon number ratios, indicating the number of patients upon which the provided ratios was based. The corresponding data with the same sequence of the colon tumor tissue versus matched normal colon tissue (T/N) are provided for convenience in comparison.

Table 9. Polynucleotides Corresponding to Differentially Expressed Genes in Metastasized Colon Cancer Tissue

Example 6: Antisense Regulation of Gene Expression

The expression of the differentially expressed genes represented by the polynucleotides in the cancerous cells can be further analyzed using antisense knockout technology to confirm the role and function of the gene product in tumorigenesis, *e.g.*, in promoting a metastatic phenotype.

Methods for analysis using antisense technology are well known in the art. For example, a number of different oligonucleotides complementary to the mRNA generated by the differentially expressed genes identified herein can be designed as antisense oligonucleotides, and tested for their ability to suppress expression of the genes. Sets of antisense oligomers specific to each candidate target are designed using the sequences of the polynucleotides corresponding to a differentially expressed gene and the software program HYBsimulator Version 4 (available for Windows 95/Windows NT or for Power Macintosh, RNAture, Inc. 1003 Health Sciences Road, West, Irvine, CA 92612 USA). Factors considered when designing antisense oligonucleotides include: 1) the secondary structure of oligonucleotides; 2) the secondary structure of the target gene; 3) the specificity with no or minimum cross-hybridization to other expressed genes; 4) stability; 5) length and 6) terminal GC content. The antisense oligonucleotide is designed to so that it will hybridize to its target sequence under conditions of high stringency at physiological temperatures (*e.g.*, an optimal temperature for the cells in culture to provide for hybridization in the cell, *e.g.*, about 37°C), but with minimal formation of homodimers.

Once synthesized and quantitated, the oligomers are screened for efficiency of a transcript knock-out in a panel of cancer cell lines. The efficiency of the knock-out is determined by analyzing mRNA levels using lightcycler quantification. The oligomers that resulted in the highest level of transcript knock-out, wherein the level was at least about 50%, preferably about 80-90%, up to 95% or more up to undetectable message, are selected for use in a cell-based proliferation assay, an anchorage independent growth assay, and an apoptosis assay.

For example, where the polynucleotide is identified as having a role in colon cancer, the ability of the corresponding designed antisense oligonucleotide to inhibit gene expression is tested through transfection into SW620 colon colorectal carcinoma cells. For each transfection mixture, a carrier molecule, preferably a lipitoid or cholesterolid, is prepared to a working concentration of 0.5 mM in water, sonicated to yield a uniform solution, and filtered through a 0.45 µm PVDF membrane. The

antisense or control oligonucleotide is then prepared to a working concentration of 100 μ M in sterile Millipore water. The oligonucleotide is further diluted in OptiMEM™ (Gibco/BRL), in a microfuge tube, to 2 μ M, or approximately 20 μ g oligo/ml of OptiMEM™. In a separate microfuge tube, lipidoid or cholesterol, typically in the amount of about 1.5-2 nmol lipidoid/ μ g antisense oligonucleotide, is diluted into the same volume of OptiMEM™ used to dilute the oligonucleotide. The diluted antisense oligonucleotide is immediately added to the diluted lipidoid and mixed by pipetting up and down. Oligonucleotide is added to the cells to a final concentration of 30 nM.

The level of target mRNA that corresponds to a target gene of interest in the transfected cells is quantitated in the cancer cell lines using the Roche LightCycler™ real-time PCR machine. Values for the target mRNA are normalized versus an internal control (e.g., beta-actin). For each 20 μ l reaction, extracted RNA (generally 0.2-1 μ g total) is placed into a sterile 0.5 or 1.5 ml microcentrifuge tube, and water added to a total volume of 12.5 μ l. To each tube 7.5 μ l of a buffer/enzyme mixture is added, which is prepared by mixing (in the order listed) 2.5 μ l H₂O, 2.0 μ l 10X reaction buffer, 10 μ l oligo dT (20 pmol), 1.0 μ l dNTP mix (10 mM each), 0.5 μ l RNasin® (20u) (Ambion, Inc., Hialeah, FL), and 0.5 μ l MMLV reverse transcriptase (50u) (Ambion, Inc.). The contents are mixed by pipetting up and down, and the reaction mixture incubated at 42°C for 1 hour. The contents of each tube are centrifuged prior to amplification.

An amplification mixture is prepared by mixing in the following order: 1X PCR buffer II, 3 mM MgCl₂, 140 μ M each dNTP, 0.175 pmol each oligo, 1:50,000 dil of SYBR® Green, 0.25 mg/ml BSA, 1 unit *Taq* polymerase, and H₂O to 20 μ l. (PCR buffer II is available in 10X concentration from Perkin-Elmer, Norwalk, CT). In 1X concentration it contains 10 mM Tris pH 8.3 and 50 mM KCl. SYBR® Green (Molecular Probes, Eugene, OR) is a dye which fluoresces when bound to double stranded DNA. As double stranded PCR product is produced during amplification, the fluorescence from SYBR® Green increases. To each 20 μ l aliquot of amplification mixture, 2 μ l of template RT are added, and amplification carried out according to standard protocols.

The results can be expressed as the percent decrease in expression of the corresponding gene product relative to non-transfected cells, vehicle-only transfected (mock-transfected) cells, or cells transfected with reverse control oligonucleotides.

Example 7: Effect of Expression on Proliferation

The effect of gene expression on the inhibition of cell proliferation can be assessed in, for example, metastatic breast cancer cell lines (MDA-MB-231 ("231")), SW620 colon colorectal carcinoma cells, or SKOV3 cells (a human ovarian carcinoma cell line).

Cells are plated to approximately 60-80% confluency in 96-well dishes. Antisense or reverse control oligonucleotide is diluted to 2 μ M in OptiMEM™ and added to OptiMEM™ into which the delivery vehicle, lipitoid 116-6 in the case of SW620 cells or 1:1 lipitoid 1:cholesteroid 1 in the case of MDA-MB-231 cells, had been diluted. The oligo/delivery vehicle mixture is then further diluted into medium with serum on the cells. The final concentration of oligonucleotide for all experiments was 300 nM, and the final ratio of oligo to delivery vehicle for all experiments is 1.5 nmol lipitoid/ μ g oligonucleotide.

Antisense oligonucleotides are prepared as described above (see Example 6). Cells are transfected overnight at 37°C and the transfection mixture replaced with fresh medium the next morning. Transfection is carried out as described above in Example 3.

Those antisense oligonucleotides that inhibit proliferation represent genes that play a role in production or maintenance of the cancerous phenotype.

Example 8: Effect of Gene Expression on Colony Formation

The effect of gene expression upon colony formation of, for example, SW620 cells, SKOV3 cells, and MD-MBA-231 cells can be tested in a soft agar assay. Soft agar assays are conducted by first establishing a bottom layer of 2 ml of 0.6% agar in media plated fresh within a few hours of layering on the cells. The cell layer is formed on the bottom layer by removing cells transfected as described above from plates using 0.05% trypsin and washing twice in media. The cells are counted in a Coulter counter, and resuspended to 10^6 per ml in media. 10 μ l aliquots are placed with media in 96-well plates (to check counting with WST1), or diluted further for the soft agar assay. 2000 cells are plated in 800 μ l 0.4% agar in duplicate wells above 0.6% agar bottom layer. After the cell layer agar solidifies, 2 ml of media is dribbled on top and antisense or reverse control oligo (produced as described in Example 6) added without delivery vehicles. Fresh media and oligos are added every 3-4 days. Colonies usually are expected to form in 10 days to 3 weeks. Fields of colonies are counted by eye. Wst-1 metabolism values can be used to compensate for small differences in starting cell number. Larger fields can be scanned for visual record of differences.

Those antisense oligonucleotides that inhibited colony formation represent genes that play a role in production or maintenance of the cancerous phenotype.

Example 9: Induction of Cell Death upon Depletion of Polypeptides by Depletion of mRNA ("Antisense Knockout")

In order to assess the effect of depletion of a target message upon cell death, SW620 cells, or other cells derived from a cancer of interest, are transfected for proliferation assays. For cytotoxic

effect in the presence of cisplatin (cis), the same protocol is followed but cells are left in the presence of 2 μ M drug. Each day, cytotoxicity was monitored by measuring the amount of LDH enzyme released in the medium due to membrane damage. The activity of LDH is measured using the Cytotoxicity Detection Kit from Roche Molecular Biochemicals. The data is provided as a ratio of LDH released in the medium vs. the total LDH present in the well at the same time point and treatment (rLDH/tLDH). A positive control using antisense and reverse control oligonucleotides for BCL2 (a known anti-apoptotic gene) is included; loss of message for BCL2 leads to an increase in cell death compared with treatment with the control oligonucleotide (background cytotoxicity due to transfection).

Example 10: Functional Analysis of Gene Products Differentially Expressed in Cancer

The gene products of sequences of a gene differentially expressed in cancerous cells can be further analyzed to confirm the role and function of the gene product in tumorigenesis, *e.g.*, in promoting or inhibiting development of a metastatic phenotype. For example, the function of gene products corresponding to genes identified herein can be assessed by blocking function of the gene products in the cell. For example, where the gene product is secreted or associated with a cell surface membrane, blocking antibodies can be generated and added to cells to examine the effect upon the cell phenotype in the context of, for example, the transformation of the cell to a cancerous, particularly a metastatic, phenotype.

Where the gene product of the differentially expressed genes identified herein exhibits sequence homology to a protein of known function (*e.g.*, to a specific kinase or protease) and/or to a protein family of known function (*e.g.*, contains a domain or other consensus sequence present in a protease family or in a kinase family), then the role of the gene product in tumorigenesis, as well as the activity of the gene product, can be examined using small molecules that inhibit or enhance function of the corresponding protein or protein family.

Additional functional assays include, but are not necessarily limited to, those that analyze the effect of expression of the corresponding gene upon cell cycle and cell migration. Methods for performing such assays are well known in the art.

Example 11: Contig Assembly and Additional Gene Characterization

The sequences of the polynucleotides provided in the present invention can be used to extend the sequence information of the gene to which the polynucleotides correspond (*e.g.*, a gene, or mRNA encoded by the gene, having a sequence of the polynucleotide described herein). This expanded sequence information can in turn be used to further characterize the corresponding gene, which in turn

provides additional information about the nature of the gene product (*e.g.*, the normal function of the gene product). The additional information can serve to provide additional evidence of the gene product's use as a therapeutic target, and provide further guidance as to the types of agents that can modulate its activity.

5 For example, a contig can be assembled using the sequence of a polynucleotide described herein. A "contig" is a contiguous sequence of nucleotides that is assembled from nucleic acid sequences having overlapping (*e.g.*, shared or substantially similar) sequence information. The sequences of publicly-available ESTs (Expressed Sequence Tags) and the sequences of various clones from several cDNA libraries synthesized at Chiron were used in the contig assembly. The contig is
10 assembled using the software program Sequencher, version 4.05, according to the manufacturer's instructions. The resulting contig can then be used to search both the public databases as well as databases internal to the applicatns to match the polynucleotide contiged with homology data and/or differential gene expressed data.

 The sequence information obtained in the contig assembly described above can be used to
15 obtain a consensus sequence derived from the contig using the Sequencher program. The consensus sequence can then be used as a query sequence in a BLASTN search of the DGTI DoubleTwist Gene Index (DoubleTwist, Inc., Oakland, CA), which contains all the EST and non-redundant sequence in public databases. Alternatively, a sequence of a polynucleotide described herein can be used directly as a query sequence in a BLASTN search of the DGTI DoubleTwist Gene Index.

20 Through contig assembly and the use of homology searching software programs, the sequence information provided herein can be readily extended to confirm, or confirm a predicted, gene having the sequence of the polynucleotides described in the present invention. Further the information obtained can be used to identify the function of the gene product of the gene corresponding to the polynucleotides described herein. While not necessary to the practice of the invention, identification of
25 the function of the corresponding gene, can provide guidance in the design of therapeutics that target the gene to modulate its activity and modulate the cancerous phenotype (*e.g.*, inhibit metastasis, proliferation, and the like).

 Although the foregoing invention has been described in some detail by way of illustration and
30 example for purposes of clarity of understanding, it is readily apparent to those of ordinary skill in the art in light of the teachings of this invention that certain changes and modifications may be made thereto without departing from the spirit or scope of the appended claims. Those skilled in the art will recognize, or be able to ascertain, using not more than routine experimentation, many equivalents to the

specific embodiments of the invention described herein. Such specific embodiments and equivalents are intended to be encompassed by the following claims.

Deposit Information.

- A deposit of the biological materials in the tables referenced below was made with the American Type Culture Collection, 10801 University Blvd., Manasas, VA 20110-2209, under the provisions of the Budapest Treaty, on or before the filing date of the present application. The accession number indicated is assigned after successful viability testing, and the requisite fees were paid. Access to said cultures will be available during pendency of the patent application to one determined by the Commissioner to be entitled to such under 37 C.F.R. §1.14 and 35 U.S.C. §122.
- All restriction on availability of said cultures to the public will be irrevocably removed upon the granting of a patent based upon the application. Moreover, the designated deposits will be maintained for a period of thirty (30) years from the date of deposit, or for five (5) years after the last request for the deposit; or for the enforceable life of the U.S. patent, whichever is longer. Should a culture become nonviable or be inadvertently destroyed, or, in the case of plasmid-containing strains, lose its plasmid, it will be replaced with a viable culture(s) of the same taxonomic description.

These deposits are provided merely as a convenience to those of skill in the art, and are not an admission that a deposit is required. A license may be required to make, use, or sell the deposited materials, and no such license is hereby granted. The deposit below was received by the ATCC on or before the filing date of the present application.

Table 11. Cell Lines Deposited with ATCC

Cell Line	Deposit Date	ATCC Accession No.	CMCC Accession No.
KM12L4-A	March 19, 1998	CRL-12496	11606
Km12C	May 15, 1998	CRL-12533	11611
MDA-MB-231	May 15, 1998	CRL-12532	10583
MCF-7	October 9, 1998	CRL-12584	10377

- In addition, pools of selected clones, as well as libraries containing specific clones, were assigned an "ES" number (internal reference) and deposited with the ATCC. Table 13 below provides the ATCC Accession Nos. of the ES deposits, all of which were deposited on or before June 13, 2000.
- The names of the clones contained within each of these deposits are provided in the tables numbered 22 and greater (inserted before the claims).

Table 13 (inserted before the claims) provides the names of the clones in each of the above libraries.

Retrieval of Individual Clones from Deposit of Pooled Clones. Where the ATCC deposit is composed of a pool of cDNA clones or a library of cDNA clones, the deposit was prepared by first

5 transfecting each of the clones into separate bacterial cells. The clones in the pool or library were then deposited as a pool of equal mixtures in the composite deposit. Particular clones can be obtained from the composite deposit using methods well known in the art. For example, a bacterial cell containing a particular clone can be identified by isolating single colonies, and identifying colonies containing the specific clone through standard colony hybridization techniques, using an oligonucleotide probe or

10 probes designed to specifically hybridize to a sequence of the clone insert (e.g., a probe based upon unmasked sequence of the encoded polynucleotide having the indicated SEQ ID NO). The probe should be designed to have a T_m of approximately 80°C (assuming 2°C for each A or T and 4°C for each G or C). Positive colonies can then be picked, grown in culture, and the recombinant clone isolated. Alternatively, probes designed in this manner can be used to PCR to isolate a nucleic acid

15 molecule from the pooled clones according to methods well known in the art, e.g., by purifying the cDNA from the deposited culture pool, and using the probes in PCR reactions to produce an amplified product having the corresponding desired polynucleotide sequence.

Table 3A · Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
1	AJ251957	<i>Ciona intestinalis</i> mRNA for nuclear lamin (lamin L2 gene)	2.2
2	AF133812	<i>Strongylocentrotus pallidus</i> isolate pR31 bindin gene, partial cds	0.88
3	AF051651	<i>Homo sapiens</i> squalene synthase gene, intron 3, 5' end	0.0001
4	NM_016701	<i>Mus musculus</i> nestin (Nes), mRNA	0.24
5	Y09000	<i>R.norvegicus</i> mRNA for dendrin	0.11
6	U67519	<i>Methanococcus jannaschii</i> section 61 of 150 of the complete genome	6.1
7	AK005889	<i>Mus musculus</i> adult male testis cDNA, RIKEN full-length enriched library, clone:1700012B08, full insert sequence	e-139
8	AB029343	<i>Homo sapiens</i> HCR (a-helix coiled-coil rod homologue) gene, complete cds	0.023
9	AB017505	<i>Homo sapiens</i> mRNA for Nori-2p, complete cds	0
10	AY024246	<i>Oryza sativa</i> microsatellite MRG6571 containing (TCTA) _{X6} , genomic sequence	6.3
11	U32309	<i>Acipenser fulvescens</i> Af14 cytochrome b gene, partial cds, tRNA-Thr, tRNA-Pro and partial D-loop, mitochondrial genes encoding mitochondrial products	6.3
12	XM_046070	<i>Homo sapiens</i> KIAA0853 protein (KIAA0853), mRNA	3E-48
13	AK001945	<i>Homo sapiens</i> cDNA FLJ11083 fis, clone PLACE1005232	2.2
14	AF111457	<i>Meleagris gallopavo</i> clone TUCA1141 microsatellite sequence	0.076
15	AK018499	<i>Mus musculus</i> adult male colon cDNA, RIKEN full-length enriched library, clone:9030409O13, full insert sequence	0
16	AE002648	<i>Drosophila melanogaster</i> genomic scaffold 142000013385436, complete sequence	2.2
17	AC001011	<i>Homo sapiens</i> (subclone 1_e5 from P1 H43) DNA sequence, complete sequence	0.003
18	XM_039942	<i>Homo sapiens</i> Meis (mouse) homolog 3 (MEIS3), mRNA	0.75
19	AF099003	<i>Caenorhabditis elegans</i> cosmid Y59C2A	0.75
20	U92972	<i>Mus musculus</i> protease-activated receptor 3 (PAR3) mRNA, complete cds	0.08
21	AE003935	<i>Xylella fastidiosa</i> 9a5c, section 81 of 229 of the complete genome	0.067
22	AB031009	<i>Homo sapiens</i> DNA, MHC class I CL region, 7.1 ancestral haplotype	0.019
23	X94207	<i>H.sapiens</i> TPR gene (1365bp)	4.8
24	AK025678	<i>Homo sapiens</i> cDNA: FLJ22025 fis, clone HEP08518	2.2
25	AK014552	<i>Mus musculus</i> 0 day neonate skin cDNA, RIKEN full-length enriched library, clone:4632404O06, full insert sequence	e-176
26	XM_044013	<i>Homo sapiens</i> kinesin-like protein 2 (hklp2), mRNA	0

219	AE001177	<i>Borrelia burgdorferi</i> (section 63 of 70) of the complete genome	0.094
220	AK018148	<i>Mus musculus</i> adult male medulla oblongata cDNA, RIKEN full-length enriched library, clone:6330408P11, full insert sequence	1.6
221	AF271148	<i>Botryosphaeria ribis</i> isolate 96-131 small subunit ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.65
222	XM_008090	<i>Homo sapiens</i> KIAA0419 gene product (KIAA0419), mRNA	0.25
223	Z54541	<i>H.sapiens</i> CpG island DNA genomic MseI fragment, clone 132c11, forward read cpg132c11.flb	6.4

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
225	XM_042689	Homo sapiens fasciculation and elongation protein zeta 2 (zygin II) (FEZ2), mRNA	0.69
226	AF317083	Anoplostoma viviparum isolate Brh10 large subunit ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.22
227	AE006436	Lactococcus lactis subsp. lactis IL1403 section 198 of 218 of the complete genome	0.029
228	AK027535	Homo sapiens cDNA FLJ14629 fis, clone NT2RP2000448, weakly similar to KES1 PROTEIN	7E-76
229	BC004209	Homo sapiens, NIMA (never in mitosis gene a)-related kinase 6, clone MGC:4434 IMAGE:2958695, mRNA, complete cds	3E-36
230	AC002183	Homo sapiens (subclone 2_h8 from BAC H111) DNA sequence, complete sequence	0.0000004
231	AF242489	Prochlorococcus marinus UreC (ureC), UreB (ureB), UreA (ureA), UreD (ureD), UreE (ureE), UreF (ureF), and UreG (ureG) genes, complete cds	0.0003
232	AF385396	Homo sapiens psoriasis susceptibility gene, partial sequence	0.027
233	AE006749	Sulfolobus solfataricus section 108 of 272 of the complete genome	2.1
234	X73501	H.sapiens gene for cytokeratin 20	0.25
235	AJ296801	Glyptotendipes pallens 18S rRNA gene (partial), 2S rRNA gene, 28S rRNA gene (partial), internal transcribed spacer 1 (ITS1) and internal transcribed spacer 2 (ITS2), clone Gpaits9	0.49
236	X17627	C. thummi DNA transposable element TECth1	0.59
237	AF157924	Eutamias dorsalis cytochrome b (cytb) gene, complete cds; mitochondrial gene for mitochondrial product	0.19
238	XM_040836	Homo sapiens similar to calcium channel, voltage-dependent, alpha 1H subunit (H. sapiens) (LOC91809), mRNA	0.38
239	AF097103	Oreina melanocephala 16S large subunit ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.23
240	AK013974	Mus musculus 13 days embryo head cDNA, RIKEN full-length enriched library, clone:3110002D09, full insert sequence	0.73
241	AK022073	Homo sapiens cDNA FLJ12011 fis, clone HEMBB1001653	0.26
242	XM_012392	Homo sapiens ubiquitin specific protease 8 (USP8), mRNA	2
243	AB048604	Mus musculus Neu-2 mRNA for sialidase, complete cds	0.54
244	AF275235	Drepanaphis utahensis 12S small subunit ribosomal RNA gene, partial sequence; tRNA-Val gene, complete sequence; and 16S large subunit ribosomal RNA gene, partial sequence; mitochondrial genes for mitochondrial products	0.076
245	XM_032956	Homo sapiens cat eye syndrome chromosome region, candidate 2 (CECR2), mRNA	2.2
246	XM_050246	Homo sapiens secretory protein SEC8; KIAA1699 protein (SEC8), mRNA	0
247	X69200	D.tigrina Dth-1 gene, exon 2	0.49
248	M33582	O.cuniculus beta-casein gene, complete cds	0.006
250	AB048604	Mus musculus Neu-2 mRNA for sialidase, complete cds	0.46

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
251	U48594	<i>Heliothis virescens</i> insect storage protein (SP4) mRNA, partial cds	0.022
252	AL162583	Human DNA sequence from clone RP1-250J21 on chromosome Xp11.22-11.4, complete sequence [Homo sapiens]	0.2
253	AF284038	<i>Cucurbita maxima</i> phloem serpin-1 mRNA, complete cds	0.19
254	AK026699	Homo sapiens cDNA: FLJ23046 fis, clone LNG02491	0.6
255	AF069199	<i>Trioxys betulae</i> NADH dehydrogenase 1 gene, mitochondrial gene encoding mitochondrial protein, partial cds	0.19
256	Z12028	<i>L.pimpinellifolium</i> gene encoding vacuolar invertase	0.7
257	AB041256	<i>Panonychus mori</i> mitochondrial CO1 gene for cytochrome oxidase subunit 1, partial cds, strain: TtDe	0.21
258	AK022820	Homo sapiens cDNA FLJ12758 fis, clone NT2RP2001328	0.25
259	AE006782	<i>Sulfolobus solfataricus</i> section 141 of 272 of the complete genome	1.4
260	AF027656	Homo sapiens cholesteryl ester transfer protein gene, promoter region	0.00004
261	Z57957	H.sapiens CpG island DNA genomic MseI fragment, clone 22b3, reverse read cpg22b3.rt1a	0.00003
262	AF266097	<i>Orthetrum cancellatum</i> large subunit ribosomal RNA gene, partial sequence; tRNA-Valine gene, complete sequence; and small subunit ribosomal RNA gene, partial sequence; mitochondrial genes for mitochondrial products	0.077
263	XM_003119	Homo sapiens dynein light chain-A (LOC51143), mRNA	5.6
264	AF099990	<i>Rattus norvegicus</i> Ste-20 related kinase SPAK mRNA, complete cds	0.54
265	AE007394	<i>Streptococcus pneumoniae</i> section 77 of 194 of the complete genome	2.2
266	L07545	<i>Leishmania tarentolae</i> kinetoplast mitochondrial MURF2 edited mRNA, complete cds	0.002
267	L09706	Homo sapiens complement component 2 (C2) gene allele b, exons 1 through 8	0.073
268	AF174326	<i>Pauesia unilachni</i> 16S ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.063
269	Z79794	<i>M.musculus</i> dystrobrevin gene, exon 8	1.8
270	AB029325	<i>Oryza sativa</i> gene for water channel protein RWC3, promoter region and complete cds	1.7
271	U42461	<i>Xenopus laevis</i> neural specific DNA binding protein (Xgli3) mRNA, complete cds	1.6
272	XM_029784	Homo sapiens CGI-53 protein (LOC51098), mRNA	6E-23
273	D14011	Mouse reg II gene for regenerating protein II, complete cds	0.071
274	AF179235	Homo sapiens short-chain dehydrogenase/reductase 1 (SDR1) gene, exons 2, 3, and 4	2.1

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
275	AF264911	Campylobacter jejuni putative UDP-N-acetylmuramate-alanine ligase (murC) gene, partial cds; putative integral membrane protein, putative MutS (mutS), restriction and modification enzyme CjeI (cjeI), putative transferase, and putative integral membrane >	0.22
276	AF266074	Gomphus exilis large subunit ribosomal RNA gene, partial sequence; tRNA-Valine gene, complete sequence; and small subunit ribosomal RNA gene, partial sequence; mitochondrial genes for mitochondrial products	0.021
277	AF229988	Cryptosporidium parvum P-type ATPase3 gene, complete cds	1.9
278	AF250346	Xenopus laevis early growth response protein 1 (egr1) gene, partial cds	0.25
279	AL157448	Homo sapiens mRNA; cDNA DKFZp761E0311 (from clone DKFZp761E0311)	0.00001
280	AF386078	Homo sapiens serine-cysteine proteinase inhibitor clade C member 1 (SERPINC1) gene, complete cds	2.1
281	S80932	MVAT5-RX2 VSG=variant surface glycoprotein {promoter} [Trypanosoma brucei=African trypanosomes, Genomic, 6583 nt]	0.003
282	U09478	Dictyostelium discoideum KAx-3 LagC protein (lagC) mRNA, complete cds	0.008
283	U63580	Oxytricha fallax micronuclear actin I gene, partial sequence	0.022
284	AF348411	Macaca mulatta Per4 pseudogene sequence	0.0008
285	AF053645	Homo sapiens cellular apoptosis susceptibility protein (CSE1) gene, exons 3 through 10	0.0002
287	U90928	Arabidopsis thaliana glyoxalase II mitochondrial isozyme (Glx2-1) mRNA, nuclear gene encoding mitochondrial protein, complete cds	2.2
288	AB050751	Carabus pseudopusio mitochondrial ND5 gene for NADH dehydrogenase subunit 5, partial cds	1.6
289	AF275220	Prociphilus fraxinifolii 12S small subunit ribosomal RNA gene, partial sequence; tRNA-Val gene, complete sequence; and 16S large subunit ribosomal RNA gene, partial sequence; mitochondrial genes for mitochondrial products	0.003
290	NM_014358	Homo sapiens C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 9 (CLECSF9), mRNA	0.009
291	D25274	Homo sapiens mRNA, clone:PO2ST9	1E-38
292	AF111936	Callithrix jacchus isolate MJ50037 alpha (1,2) fucosyltransferase (FUT1) gene, partial cds	1.8
293	AL592159	Human DNA sequence from clone RP13-237P14 on chromosome X, complete sequence [Homo sapiens]	0.18
294	AK013928	Mus musculus 13 days embryo head cDNA, RIKEN full-length enriched library, clone:3100003M19, full insert sequence	1.9
295	AF289199	Mus musculus junctin and aspartyl beta-hydroxylase (Asph) genes, partial cds	0.079

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
296	AE001425	Plasmodium falciparum chromosome 2, section 62 of 73 of the complete sequence	0.008
297	XM_011029	Homo sapiens LIM domain-containing preferred translocation partner in lipoma (LPP), mRNA	0.23
298	AF105034	Arabidopsis thaliana delta7 sterol C-5 desaturase (STE1) gene, complete cds	0.009
299	L77040	Homo sapiens (subclone 8_c11 from P1 H22) DNA sequence	9E-14
300	AF278536	Parastrongyloides trichosuri heat shock 70 protein gene, complete cds	0.61
302	Z28216	S.cerevisiae chromosome XI reading frame ORF YKL216w	1.7
303	AJ008049	Chrysolina colasi 16S rRNA gene	0.0007
304	AF280812	Glycine max putative Hs1pro-1-like receptor mRNA, complete cds	0.67
305	AK007831	Mus musculus 10 day old male pancreas cDNA, RIKEN full-length enriched library, clone:1810048N21, full insert sequence	0.047
306	AL163543	Human DNA sequence from clone RP11-424E21 on chromosome 13, complete sequence [Homo sapiens]	0.64
307	AF045022	Bos taurus phosphatidic acid-preferring phospholipase A1 mRNA, complete cds	5
308	AB052731	Oikopleura longicauda OilBra mRNA for brachyury protein, complete cds	1.8
309	AF194275	Holbrookia maculata clone HMFL 12S ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	6.3
310	AJ400814	Dictyostelium discoideum srfA gene, alternative promoters	0.024
311	AK002854	Mus musculus adult male kidney cDNA, RIKEN full-length enriched library, clone:0610039P13, full insert sequence	0.68
312	U25177	Helobdella robusta cyclin A mRNA, partial cds	0.023
313	AK011102	Mus musculus 13 days embryo liver cDNA, RIKEN full-length enriched library, clone:2510044F14, full insert sequence	0.51
314	AK002181	Homo sapiens cDNA FLJ11319 fis, clone PLACE1010293	0.0006
315	U67282	Human mis5 homolog (MCM6) gene, exon x	0.014
316	XM_040357	Homo sapiens chromosome 6 open reading frame 5 (C6orf5), mRNA	1.5
317	AK006073	Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:1700017M07, full insert sequence	6.7
318	AE001381	Plasmodium falciparum chromosome 2, section 18 of 73 of the complete sequence	0.18
319	NM_017678	Homo sapiens hypothetical protein FLJ20127 (FLJ20127), mRNA	3E-57
320	BC004680	Mus musculus, Similar to coxsackievirus and adenovirus receptor, clone MGC:5878 IMAGE:3500491, mRNA, complete cds	0.24
321	AK002181	Homo sapiens cDNA FLJ11319 fis, clone PLACE1010293	0.007
322	U90946	Dictyostelium discoideum myosin heavy chain kinase B (MHCK-B) mRNA, complete cds	0.003
323	Y14277	Drosophila melanogaster mRNA for nuclear protein SA	0.062

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSION	DESCRIP	P VALUE
324	Z17272	H. sapiens DNA segment containing (CA) repeat; clone AFM248wc1; single read	0.25
325	M37526	E. gracilis chloroplast P-700 chlorophyll alpha apoprotein (psaA and psaB) genes, complete cds	0.025
326	Y14952	Mus musculus gene encoding immunoglobulin J chain precursor	0.24
327	AE006596	Streptococcus pyogenes M1 GAS strain SF370, section 125 of 167 of the complete genome	6.8
328	AF079804	Candida albicans N-acetyl-glucosamine-6-phosphate deacetylase (DAC1) and glucosamine-6-phosphate deaminase (NAG1) genes, complete cds; and hexokinase (H XK1) pseudogene, complete sequence	2

401	U39694	Mycoplasma genitalium section 16 of 51 of the complete genome	0.84
402	XM_016314	Homo sapiens ankyrin 2, neuronal (ANK2), mRNA	4.6

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
403	XM_045362	Homo sapiens likely homolog of rat kinase D-interacting substance of 220 kDa; KIAA1250 protein (KIAA1250), mRNA	7E-77
404	NM_028513	Mus musculus RIKEN cDNA 1700052K15 gene (1700052K15Rik), mRNA	9
405	U47416	Solanum allophyllum NADH dehydrogenase subunit (ndhF) gene, chloroplast gene encoding chloroplast protein, partial cds	0.2
406	NC_002502	Lactococcus lactis subsp. lactis plasmid pCI305, complete sequence	5.3
407	AF269561	Staphylococcus epidermidis strain SR1 clone step.1010e06 genomic sequence	0.19
409	AF336128	Lumpy skin disease virus strain Neethling, 5' partial sequence	1.5
410	AB058397	Oryza sativa CHS gene for chalcone synthase, complete cds	0.16
411	AE006830	Sulfolobus solfataricus section 189 of 272 of the complete genome	0.21
412	AY035064	Arabidopsis thaliana unknown protein (T20O10_100/AT3g63000) mRNA, complete cds	0.22
413	AF158049	Platybrachys decemmacula 16S ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.063
414	NM_026444	Mus musculus citrate synthase (Cs), mRNA	1.7
415	BC007820	Homo sapiens, clone IMAGE:4303165, mRNA	0
416	AJ295228	Caenorhabditis elegans mRNA for MAGUK protein DLG-1 (dlg-1 gene)	0.2
417	AB028633	Flammulina velutipes mitochondrial gene for DNA polymerase, RNA polymerase, complete and partial cds	0.6
418	Y09794	A.rabiei microsatellite DNA	1.2
419	AB054063	Pagrus major lpl gene for lipoprotein lipase, complete cds	5.9
420	AF323928	Plasmodium falciparum GcpE (gcpE) gene, complete cds	0.14
421	M31012	Chicken MHC class I B-FIV-B12 alpha-chain gene, complete cds	1.2
422	Z49806	B.taurus mRNA for adenyl cyclase type VII	6.1
423	AB009907	Luciola kuroiwae mitochondrial DNA for 16S rRNA, partial sequence	0.003
424	X76693	C.coli (UA585) sodB gene for superoxide dismutase	0.45
425	AF284942	Carex capitata tRNA-Thr, partial sequence; trnT-trnL intergenic spacer, tRNA-Leu, and trnL-trnF intergenic spacer, complete sequence; and tRNA-Phe, partial sequence; chloroplast genes for chloroplast products	0.29
426	AK017986	Mus musculus adult male thymus cDNA, RIKEN full-length enriched library, clone:5830443G21, full insert sequence	5.1
427	AL512549	S.pombe chromosome I BAC pB2B4	1.6
428	AF283669	Homo sapiens kallikrein 14 (KLK14) gene, complete cds	2.3
429	Z12842	O.cuniculus mRNA for protein of unknown function	5E-73
430	XM_016894	Homo sapiens LOC86241 (LOC86241), mRNA	3E-65
431	X96616	P.primaurelia gene encoding 156D surface antigen	0.23
432	X02175	Schizosaccharomyces pombe cdc10 start gene	0.027
433	AK021807	Homo sapiens cDNA FLJ11745 fis, clone HEMBA1005526	0.001

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
434	XM_005233	Homo sapiens protein phosphatase 2 (formerly 2A), regulatory subunit B (PR 52), alpha isoform (PPP2R2A), mRNA	5E-09
435	X52623	Rice 4-CL gene for 4-coumarate-CoA ligase (EC 6.2.1.12)	0.63
436	AK005294	Mus musculus adult male cerebellum cDNA, RIKEN full-length enriched library, clone:1500019O16, full insert sequence	1E-16
437	AE002337	Chlamydia muridarum, section 65 of 85 of the complete genome	0.049
438	AF106574	Caenorhabditis elegans cosmid E02D9, complete sequence	0.7
439	X56866	S.alba 5S rRNA gene	0.74
440	AF127158	Drosophila mauritiana Cu-Zn superoxide dismutase (Sod) gene, exons 1 and 2 and complete cds	1.7
441	U08466	Nephila clavipes alanine tRNA gene, complete sequence	2.1
442	AY021236	Oryza sativa microsatellite MRG3561 containing (TA) _{X22} , genomic sequence	1.5
443	L09262	Arabidopsis thaliana phytochrome b gene, exons 2 and 3	0.079
444	AC007095	Homo sapiens BAC clone RP11-303A22 from 7, complete sequence	0.23
445	AK012607	Mus musculus 11 days embryo cDNA, RIKEN full-length enriched library, clone:2700094F01, full insert sequence	0.19
446	AF309415	Cyprinus carpio ovarian fibroin-like substance-2 mRNA, partial cds	0.008
447	X03956	Potato (tetraploid variety Maris piper) patatin gene	0.003
448	BC008617	Mus musculus, clone IMAGE:3588380, mRNA, partial cds	0.07
449	AJ242146	Mauritiella armata 18S rRNA gene (partial), 5.8S rRNA gene, 26S rRNA gene (partial) and internal transcribed spacers 1 and 2 (ITS1, ITS2), clone 1	0.07
450	M67489	Bovine desmocollin mRNA, complete cds	0.066
451	AB048954	Macaca fascicularis brain cDNA, clone:QnpA-10509	0.48
452	AE001136	Borrelia burgdorferi (section 22 of 70) of the complete genome	0.18
453	AE001398	Plasmodium falciparum chromosome 2, section 35 of 73 of the complete sequence	0.025
454	AF218904	Homo sapiens attractin precursor (ATRN) gene, exon 19	1.6
455	AK025078	Homo sapiens cDNA: FLJ21425 fis, clone COL04162	1E-71
456	M11449	Yeast mitochondrial ori2-ori7 region DNA with putative peptide	0.34
457	XM_031156	Homo sapiens hypothetical gene supported by AB007970 (LOC90360), mRNA	0.006
458	AK015180	Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4930422I22, full insert sequence	0.007
459	AC090422	Homo sapiens clone RP11-691A12, complete sequence	0.013
460	U06154	Human clone 2004V-I-1 from chromosome 1q terminal region	1E-19
461	AE001123	Borrelia burgdorferi (section 9 of 70) of the complete genome	0.83
462	Y17797	Enterococcus faecalis gph, ydjH, ydjG, ydjI, pbp4 and ydiC, ORF2 and ORF3 genes, partial	0.22
463	AB026906	Homo sapiens SDHD gene for small subunit of cytochrome b of succinate dehydrogenase, complete cds	0.042
464	L13942	Human (clone Cos35) glycerol kinase (GK) gene, exons 1-3	0.042
465	U81510	Spodoptera frugiperda caspase-1 mRNA, complete cds	0.041

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
601	Z69388	Human DNA sequence from cosmid L60G9A, Huntington's Disease Region, chromosome 4p16.3 contains ESTs and a CpG island	0.084
602	U84760	<i>Chromatium vinosum</i> dsr locus, complete sequence	0.022
603	AF122050	<i>Hordeum vulgare</i> limit dextrinase gene, complete cds	1.8
604	AJ308471	<i>Mus musculus</i> partial gene for acetyl-CoA carboxylase-alpha, promoter I	0.022
605	AF158032	<i>Cixius inflatus</i> 16S ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.008
607	XM_012733	Homo sapiens KIAA1012 protein (KIAA1012), mRNA	0.005
608	D37781	Human mRNA for protein-tyrosine phosphatase HPTPeta, complete cds	0.059
609	AC002252	Homo sapiens (subclone 1_g7 from BAC H76) DNA sequence, complete sequence	7E-11
610	AF160964	Peanut witches'-broom phytoplasma RNA polymerase sigma factor (rpoD) gene, complete cds	0.63
611	U67528	<i>Methanococcus jannaschii</i> section 70 of 150 of the complete genome	0.67
612	AF063134	<i>Justicia caudata</i> tRNA-Leu (trnL) gene, chloroplast gene for chloroplast RNA, partial sequence	1.2
613	U67527	<i>Methanococcus jannaschii</i> section 69 of 150 of the complete genome	1.5
614	AK022455	Homo sapiens cDNA FLJ12393 fis, clone MAMMA1002711	0.000001
615	AF272082	<i>Poiretia punctata</i> trnK gene, intron, 3' partial sequence; and maturase (matK) gene, partial cds; chloroplast genes for chloroplast products	0.075
616	AF112461	Homo sapiens G protein-coupled receptor 57 (GPR57) gene, complete cds	0.025
617	AF310884	<i>Dictyostelium discoideum</i> Rac1B (rac1B) gene, complete cds; racK pseudogene, complete sequence; and unknown genes	5.6
618	AF348342	<i>Plasmodium malariae</i> caseinolytic protease C (clpC) gene, partial cds; apicoplast gene for apicoplast product	0.22
619	AB043965	<i>Danio rerio</i> gene for dharma, promoter and partial cds	0.054
620	NC_001839	<i>Petunia</i> vein clearing virus, complete genome	0.61
621	AK023959	Homo sapiens cDNA FLJ13897 fis, clone THYRO1001706	0.67
622	AF028835	<i>Drosophila pallidosa</i> vermilion (v) gene, complete cds	0.13
623	U67598	<i>Methanococcus jannaschii</i> section 140 of 150 of the complete genome	0.072
624	AF283103	Pineapple mealybug wilt associated virus-2 polyprotein (ORF1a) and RNA-dependent RNA polymerase genes, partial cds; and hydrophobic protein p5, heat shock protein 70, p46, coat protein, diverged coat protein, p20, p22, and p6 genes, complete cds	1.5
625	XM_008161	Homo sapiens hypothetical protein FLJ20345 (FLJ20345), mRNA	1E-15
626	XM_035599	Homo sapiens adaptor-related protein complex 4, epsilon 1 subunit (AP4E1), mRNA	6E-22

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
627	AF143066	Lepidopilum scabrisetum ribosomal protein system 4 (rps4) gene, partial cds	0.61
628	U89283	Biomphalaria glabrata myoglobin gene, complete cds	0.46
629	U44949	Xenopus laevis zona pellucida A glycoprotein homolog (xlZPA) mRNA, complete cds	1.6
630	AE007395	Streptococcus pneumoniae section 78 of 194 of the complete genome	0.15
631	BC006963	Mus musculus, clone IMAGE:3708410, mRNA, partial cds	1.6
632	XM_031120	Homo sapiens peptidylglycine alpha-amidating monooxygenase (PAM), mRNA	4E-40
633	AF316122	Kinosternon arizonense isolate KariAZ2 mitochondrial control region, complete sequence	0.69
634	U67561	Methanococcus jannaschii section 103 of 150 of the complete genome	0.22
635	D88010	Human DNA for ribosomal protein S13, complete cds, U14 small nucleolar RNA, complete sequence	0.24
636	AE006321	Lactococcus lactis subsp. lactis IL1403 section 83 of 218 of the complete genome	2.2
637	AF045595	Carassius auratus clone gf-40 glutamic acid decarboxylase isoform 67 (GAD67) mRNA, complete cds	0.74
638	D38378	Human DNA, novel tandem repeat sequence	0.21
639	AF260819	Plasmodium falciparum CG1 protein gene, complete cds	0.003
640	NC_000857	Ceratitis capitata complete mitochondrial genome	0.23
641	AK015383	Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4930444M15, full insert sequence	2.1
642	AF286367	Homo sapiens HMG1Y gene, promoter	1.6
643	AK019143	Mus musculus 10 days embryo cDNA, RIKEN full-length enriched library, clone:2600001P13, full insert sequence	0.69
644	AE001421	Plasmodium falciparum chromosome 2, section 58 of 73 of the complete sequence	2
645	D16904	Human HepG2 3' region cDNA, clone hmd3a02	0.21
646	XM_003799	Homo sapiens protocadherin beta 10 (PCDHB10), mRNA	0.69
647	NC_001438	Bean golden mosaic virus A component DNA, complete sequence	0.66
648	AK013971	Mus musculus 13 days embryo head cDNA, RIKEN full-length enriched library, clone:3110001P07, full insert sequence	2
649	AF078880	Prosimulium formosum dopa decarboxylase (DDC) gene, partial cds	0.076
650	AJ009600	Begonia taipeiensis rbcL promoter, clone 16320	0.22
651	AF042834	Homo sapiens phosphodiesterase delta subunit gene, exons 2, 3 and 4	5.8
652	AF244214	Dysdera ratonensis 16S ribosomal RNA gene, partial sequence	0.075
653	XM_043252	Homo sapiens PCAF associated factor 65 alpha (PAF65A), mRNA	2E-33

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
654	AF105116	<i>Streptococcus pneumoniae</i> type 19C Cps19CR (cps19CR) gene, partial cds; putative oligosaccharide repeat unit transporter (cps19CJ), UDP-N-acetyl glucosamine-2-epimerase (cps19CK), and putative glucosyl transferase (cps19CS) genes, complete cds; and gluc>	1.9
655	AF181720	<i>Homo sapiens</i> RU2AS (RU2) gene, complete cds; and RU2S (RU2) gene, partial cds	0.23
656	AL392164	Human DNA sequence from clone RP11-269L6 on chromosome X, complete sequence [<i>Homo sapiens</i>]	0.0003
657	AF189720	<i>Oryctolagus cuniculus</i> chloride channel (CFTR) mRNA, complete cds	0.18
658	AF077821	<i>Canis familiaris</i> inducible nitric oxide synthase mRNA, complete cds	0.077
659	NC_001327	<i>Ascaris suum</i> mitochondrion, complete genome	0.074
660	XM_003164	<i>Homo sapiens</i> KIAA0218 gene product (KIAA0218), mRNA	5.8
661	M22207	<i>T.gratilla</i> 217g gene encoding 217g protein, complete cds	0.071
662	BC004062	<i>Mus musculus</i> , Similar to cofactor required for Sp1 transcriptional activation, subunit 6 (77kD), clone IMAGE:3590309, mRNA, partial cds	0.22
663	AF007132	<i>Homo sapiens</i> clone 23551 mRNA sequence	0.023
666	XM_007847	<i>Homo sapiens</i> hypothetical protein from clone 24796 (LOC57146), mRNA	5E-32
667	AE002755	<i>Drosophila melanogaster</i> genomic scaffold 142000013385531, complete sequence	5.8
668	U70780	<i>Clostridium botulinum</i> unidentified protein P-48 gene, complete cds and neurotoxin binding protein gene, partial cds	0.075
669	XM_029131	<i>Homo sapiens</i> similar to KIAA0773 gene product (<i>H. sapiens</i>) (LOC90115), mRNA	2
670	XM_003091	<i>Homo sapiens</i> KIAA0001 gene product; putative G-protein-coupled receptor; G protein coupled receptor for UDP-glucose (KIAA0001), mRNA	1.7
671	AF284881	<i>Carex pauciflora</i> tRNA-Thr, partial sequence; trnT-trnL intergenic spacer, tRNA-Leu, and trnL-trnF intergenic spacer, complete sequence; and tRNA-Phe, partial sequence; chloroplast genes for chloroplast products	1.6
672	NC_001381	Plasmid pAL5000, complete sequence	6.1
673	AF081201	<i>Arabidopsis thaliana</i> villin 1 (VLN1) mRNA, complete cds	0.21
674	AK023674	<i>Homo sapiens</i> cDNA FLJ13612 fis, clone PLACE1010833, weakly similar to CALTRACTIN	0.54
675	X60097	<i>Streptococcus</i> sp. (group C) emm gene for M protein	0.063
676	AF026087	<i>Schizosaccharomyces pombe</i> Sat1 gene, partial cds	0.22
677	X00117	Galago Alu repeat type I, GAL9	0.0001
678	AJ276629	<i>Rattus norvegicus</i> Sacm21/RT1-A intergenic region, haplotype RT1n and partial RT1-A gene for MHC Class I antigen	1.9
679	AK021058	<i>Mus musculus</i> adult male corpus striatum cDNA, RIKEN full-length enriched library, clone: C030009O12, full insert sequence	0.23

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
680	BC003727	Mus musculus, Similar to Interleukin 1 alpha, clone MGC:5780 IMAGE:3599550, mRNA, complete cds	1.9
681	XM_048261	Homo sapiens similar to ring finger protein 23; RING-B box-coiled coil-B30.2 (M. musculus) (LOC92947), mRNA	5E-18
682	XM_038154	Homo sapiens KIAA1016 protein (KIAA1016), mRNA	0.23
683	XM_049918	Homo sapiens similar to hypothetical protein MGC10940 (H. sapiens) (LOC93230), mRNA	0
684	X14727	Sheep beta-B globin gene	0.68
685	AB052187	Macaca fascicularis brain cDNA, clone:QnpA-12170	0.024
686	AK004783	Mus musculus adult male lung cDNA, RIKEN full-length enriched library, clone:1200015E14, full insert sequence	5.8
687	AE002799	Drosophila melanogaster genomic scaffold 142000013385566, complete sequence	0.003
688	AF190395	Corymbia calophylla tRNA-Leu and tRNA-Phe genes, partial sequence; chloroplast genes for chloroplast products	1.9
689	U57896	Candida albicans cytochrome C gene (CYC1) gene, complete cds	0.22
690	AE006710	Sulfolobus solfataricus section 69 of 272 of the complete genome	2
691	AL392164	Human DNA sequence from clone RP11-269L6 on chromosome X, complete sequence [Homo sapiens]	0.0003
692	D87001	Homo sapiens immunoglobulin lambda gene locus DNA, clone:47H9 downstream contig	0.008
693	Y13853	Drosophila erecta clone Er1 inactive Bari-1 family transposon	0.16
694	AB022927	Oryctolagus cuniculus HAC4 mRNA for hyperpolarization activated cation channel, complete cds	0.66
695	AF307327	Araraquara virus medium RNA segment, G1/G2 glycoprotein precursor gene, partial cds	2
696	AF269369	Staphylococcus epidermidis strain SR1 clone step.1002g02 genomic sequence	0.57
697	XM_043252	Homo sapiens PCAF associated factor 65 alpha (PAF65A), mRNA	2E-33
698	XM_008640	Homo sapiens lethal giant larvae (Drosophila) homolog 1 (LLGL1), mRNA	0.22
699	AC024829	Caenorhabditis elegans cosmid Y55F3BM, complete sequence	0.023
700	M83660	Dictyostelium discoideum clathrin heavy chain (chcA) mRNA, complete cds	1.9
701	X95481	S.cerevisiae ARC1 gene	1.9
702	AJ408897	Homo sapiens chromosomal breakpoint fragment derivative 4, AF4/MLL fusion, patient UPN006	4.9
703	AF110007	Molgula oculata p68 RNA helicase (bobcat) and transcription factor (manx) genes, complete cds	0.68
704	AL133339	Human DNA sequence from clone RP4-807J1 on chromosome 20. Contains a GSS and a CpG island, complete sequence [Homo sapiens]	2
705	U10116	Human superoxide dismutase (SOD3) gene, complete cds	0.23
706	AB037771	Homo sapiens mRNA for KIAA1350 protein, partial cds	0

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSION	DESCRIP	P VALUE
707	AF023840	Homo sapiens natural killer group protein 2-A (NKG2-A) gene, complete cds	0.68
708	U49023	Tegeticula maculata extranea cytochrome oxidase subunit I, cytochrome oxidase subunit II genes, mitochondrial genes encoding mitochondrial proteins, partial cds, and tRNA-Leu gene, mitochondrial gene	0.001
709	XM_044768	Homo sapiens similar to death receptor 6 (H. sapiens) (LOC92385), mRNA	e-126
710	D50006	Human DNA for alpha-platelet-derived growth factor receptor, exon 6-10	2.1
711	Y14524	Tetrahymena thermophila tRNA-Tyr gene, exons 1 and 2, clone pTetY2	0.057
712	AL592159	Human DNA sequence from clone RP13-237P14 on chromosome X, complete sequence [Homo sapiens]	0.52
713	U88825	HIV-1 isolate 92NG003 from Nigeria complete genome	3.1
714	U05813	Blastocrithidia culicis ATCC 30268 kinetoplast (MURF1) and apocytochrome B (cytB) genes, partial cds, and ATPase subunit 6 (MURF4) gene, complete pre-RNA-edited DNA sequence	0.23
715	AF048990	Homo sapiens MutS homolog 5 (MSH5) gene, exons 11 and 12	0.0009
716	AF317082	Adoncholaimus thalassophygas isolate Sou39 large subunit ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.0008
717	AK013269	Mus musculus 10, 11 days embryo cDNA, RIKEN full-length enriched library, clone:2810439K08, full insert sequence	0.024
718	L14769	Physarum polycephalum cytochrome oxidase subunit 1 mRNA, complete cds; mitochondrial gene for mitochondrial product	1.6
720	U45453	Xenopus laevis transcription factor xGATA-4 mRNA, complete cds	0.61
721	AF090432	Danio rerio serrateB mRNA, complete cds	0.075
722	M62504	Spiroplasma citri fibril protein gene, complete cds	0.024
723	AK000939	Homo sapiens cDNA FLJ10077 fis, clone HEMBA1001864	0
724	XM_032587	Homo sapiens 2127 (KIAA1754), mRNA	0.22
726	AF012899	Sambucus nigra ribosome inactivating protein precursor mRNA, complete cds	0.000001
727	S82175	RAR-gamma 2.2=retinoic acid receptor gamma isoform 2.2 {alternatively spliced} [Xenopus laevis, embryos, stage 24, mRNA, 2154 nt]	0.008
728	AK002856	Mus musculus adult male kidney cDNA, RIKEN full-length enriched library, clone:0610040A09, full insert sequence	0.44
729	AF077828	Oryctolagus cuniculus indolethylamine N-methyltransferase (INMT) gene, exon 3 and complete cds	1.4
730	BC006633	Mus musculus, Flt3 interacting zinc finger protein 1, clone MGC:7201 IMAGE:3482191, mRNA, complete cds	1.3
731	AK024670	Homo sapiens cDNA: FLJ21017 fis, clone CAE05907	0.5
732	Z35823	S.cerevisiae chromosome II reading frame ORF YBL062w	1.1
733	Z48636	C.novyi gene for alpha-toxin	0.065

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
734	BC008580	Homo sapiens, clone IMAGE:4179986, mRNA, partial cds	0.71
735	L37746	Homo sapiens lamin B1 gene, exon 10	0.11
736	AF142372	Anolis roquet cytochrome b gene, partial cds; mitochondrial gene for mitochondrial product	0.95
737	AF107454	Homo sapiens clone cD622 mRNA sequence	0.48
738	XM_010112	Homo sapiens solute carrier family 6 (neurotransmitter transporter), member 14 (SLC6A14), mRNA	0.5
739	AF188067	Arabidopsis thaliana clone AtDP5 isopentenyl pyrophosphate:dimethylallyl pyrophosphate isomerase (ipiAt2) mRNA, partial cds	1.6
740	X90383	A.thaliana DNA for Y13 gene	0.034
741	AE004309	Vibrio cholerae chromosome I, section 217 of 251 of the complete chromosome	0.18
742	AF236642	Calothrix parietina clone 102-2A 16S-23S internal transcribed spacer, complete sequence; and tRNA-Ile and tRNA-Ala genes, complete sequence	1.1
744	AF107699	Homo sapiens RING3 protein (RING3) gene, partial cds	0.027
745	XM_035624	Homo sapiens KIAA0876 protein (KIAA0876), mRNA	3.4
746	XM_001795	Homo sapiens lamin B receptor (LBR), mRNA	0.15
747	AF395180	Panteliella bicolor cytochrome oxidase subunit I gene, partial cds; mitochondrial gene for mitochondrial product	0.093
748	AF262633	Homo sapiens clone NIGMS NA11418 chromosome 15 paralogous sequence variant, genomic sequence	0.27
749	AF086375	Homo sapiens full length insert cDNA clone ZD68B12	0.000003
750	AJ271002	Mus musculus TFF1/pS2 gene for Trefoil Factor1/pS2, exons 1-3	0.8
751	AF063681	Mus musculus type XIII collagen (col13a1) gene, exons 22-27	0.53
752	AL031634	Caenorhabditis elegans cosmid Y32B12C, complete sequence	0.053
753	Y00165	Sus scrofa mRNA for link protein	0.065
754	AP000693	Homo sapiens genomic DNA, chromosome 21q22.2, PCR fragment from BAC clone:KB739C11, CBR1-HLCS region	0.022
755	AK021535	Homo sapiens cDNA FLJ11473 fis, clone HEMBA1001712	0.064
756	AF305539	Mus musculus B lymphocyte induced maturation protein 1 (Prdm1) gene, exon 8 and complete cds	4E-12
757	J05493	S.pombe no message in thiamine protein (nmt1) gene, complete cds	0.55
758	AE001480	Helicobacter pylori, strain J99 section 41 of 132 of the complete genome	0.51
759	AF072685	Bos taurus matrix metalloproteinase 13 (MMP13) mRNA, complete cds	0.072
760	XM_038408	Homo sapiens hypothetical protein FLJ11331 (FLJ11331), mRNA	0.6
761	XM_041148	Homo sapiens hypothetical gene supported by AF037219 (LOC91856), mRNA	1.7
762	AF234897	Haemulon plumieri Hpl224 NADH dehydrogenase I (ND-1) gene, complete cds; mitochondrial gene for mitochondrial product	3

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
763	NM_008399	Mus musculus integrin, alpha E, epithelial-associated (Itgae), mRNA	1.4
764	Z74898	S.cerevisiae chromosome XV reading frame ORF YOL156w	1.8
765	AF280812	Glycine max putative Hs1pro-1-like receptor mRNA, complete cds	0.59
766	AB013615	Broad bean wilt virus 2 genomic RNA, complete sequence of RNA1	0.68
768	AF079169	Nicotiana tabacum feedback-insensitive anthranilate synthase alpha-2 chain (ASA2) gene, promoter region and 5'UTR	5.9
769	AB014079	Homo sapiens genomic DNA, chromosome 6p21.3, HLA class I region, Cosmid clone:TY1E11, complete sequence	0.007
770	XM_012336	Homo sapiens MBIP protein (MBIP), mRNA	0.0003
771	U41509	Caenorhabditis elegans cosmid W03H1, complete sequence	0.18
772	U23478	Dictyostelium discoideum phosphatidylinositol-4,5-diphosphate 3-kinase (PIK3) mRNA, partial cds	0.00002
773	AP000380	Arabidopsis thaliana genomic DNA, chromosome 5, genomic PCR product GA469	0.39
774	AF115772	Danio rerio basic helix-loop-helix transcription factor Ndr1a (ndr1a) mRNA, complete cds	0.2
775	XM_007458	Homo sapiens butyrate response factor 1 (EGF-response factor 1) (BRF1), mRNA	0.42
776	L31955	Human (clone 1NIB-2) normalized cDNA library sequence	1.6
777	D49711	Populus kitakamiensis (P. sieboldii X P. grandidentata) homt3 gene for caffeic acid O-methyltransferase, complete cds (exon1-4)	0.046
778	L49234	Manduca sexta chitinase precursor gene, complete cds	0.05
779	AY008848	Ictalurus punctatus clone Icpu-UA/3 MHC class I antigen gene, complete cds	0.015
780	AB048375	Oserya coulteriana chloroplast matK gene for maturase K, complete cds	1.9
781	XM_010323	Homo sapiens toll-like receptor 7 (TLR7), mRNA	0.21
782	X69121	P.falciparum Pfgrp mRNA for heat shock protein	0.18
783	AE001570	Helicobacter pylori, strain J99 section 131 of 132 of the complete genome	0.05
784	M31756	Human t(9;22) chromosome 9 breakpoint DNA	0.77
785	M37889	Staphylococcus aureus replication (rep), control of replication (cop), and resistance protein (QacC) genes, complete cds	0.2
786	AF091326	Plasmodium falciparum histone deacetylase (HDAC1) mRNA, complete cds	0.19
787	Z74851	S.cerevisiae chromosome XV reading frame ORF YOL109w	0.2
788	Z85396	H.sapiens Ig lambda light chain variable region gene (34-34SWIIF32) rearranged; Ig-Light-Lambda; VLambda	0.56
789	AF075681	Hemorrhagic enteritis virus hexon protein gene, partial cds	2.1
790	AY029613	Mus musculus GTP binding protein 3 gene, complete cds; nuclear gene for mitochondrial product	5.8
791	NC_001338	Sulfolobus virus 1, complete genome	0.63

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
792	U67563	Methanococcus jannaschii section 105 of 150 of the complete genome	0.11
794	U67549	Methanococcus jannaschii section 91 of 150 of the complete genome	0.21
795	AF293450	Canis familiaris BPAG1-like gene sequence	0.53

1389	XM_003052	Homo sapiens roundabout (axon guidance receptor, Drosophila) homolog 1 (ROBO1), mRNA	1E-49
1390	AF208532	Homo sapiens fatty acid omega-hydroxylase CYP4A11 (CYP4A11) gene, complete cds	0.69
1391	AF233326	Mus musculus tumor necrosis factor receptor-associated factor (Traf2) gene, exons 2, 3, and 4	0.72
1392	AE001413	Plasmodium falciparum chromosome 2, section 50 of 73 of the complete sequence	0.15
1394	X54889	Sea urchin developmentally regulated ectodermal gene	0.023

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
1395	AF378868	Arabidopsis thaliana AT5g11200/F2I11_90 mRNA, complete cds	2.5
1396	AF328539	Homo sapiens clone 12qtel_c64t3 sequence	0.0003
1397	AE006450	Lactococcus lactis subsp. lactis IL1403 section 212 of 218 of the complete genome	0.47
1398	Z12840	O.cuniculus mRNA for protein of unknown function	2E-97
1399	U31165	Rattus norvegicus SH3 domain binding protein (CR16) gene, exon 6	1.9
1400	Y15005	Bison bonasus mitochondrial cytB gene	1.8
1401	AC091267	Caenorhabditis elegans cosmid Y37B11A, complete sequence	3.7
1402	AB055364	Macaca fascicularis brain cDNA, clone:QfIA-12522	e-119
1403	NC_001610	Didelphis virginiana mitochondrion, complete genome	0.006
1404	AF362372	Dictyostelium discoideum histidine kinase DhkJ (dhkJ) gene, complete cds	0.055
1405	AF027164	Homo sapiens type II integral membrane protein (NKG2-E) gene, partial cds; and type II integral membrane protein (NKG2-F) gene, complete cds	3.6
1406	M76376	Human cysteine-rich protein (CRP) gene, exon 2	0.027
1407	D31863	Mouse Pig-a gene for GPI-anchor biosynthesis (PIG-A protein), exon 6 and complete cds	0.026
1408	XM_031315	Homo sapiens hypothetical protein FLJ14033 similar to hypoxia inducible factor 3, alpha subunit (FLJ14033), mRNA	0.000007
1409	AY019369	Oryza sativa microsatellite MRG1694 containing (AT)X32, genomic sequence	0.0001
1410	AF067610	Caenorhabditis elegans cosmid F41A4	0.084
1411	AJ401391	Drosophila melanogaster mRNA for PDGF/VEGF-like protein (CG7103 gene)	0.18
1412	XM_008417	Homo sapiens hypothetical protein FLJ20694 (FLJ20694), mRNA	0.0000001
1413	AF242195	Homo sapiens KLK15 (KLK15) gene, complete cds, alternatively spliced	e-160
1414	Y14077	Bacillus subtilis 10.6 Kb chromosomal DNA: glyB-prsA region	0.008
1415	AE006802	Sulfolobus solfataricus section 161 of 272 of the complete genome	0.057
1416	AY007149	Homo sapiens clone CDABP0086 mRNA sequence	0.092
1417	K02628	Oxytricha nova (hypotrichous ciliate) (clones LMIC2-(5,6,8)) micronuclear DNA, C2 gene (version 3), complete cds	0.063
1419	X14260	Xenopus tropicalis alpha-globin gene	1.7
1420	AJ401391	Drosophila melanogaster mRNA for PDGF/VEGF-like protein (CG7103 gene)	0.15
1421	XM_032580	Homo sapiens nebullette (NEBL), mRNA	1.3
1422	XM_008060	Homo sapiens solute carrier family 7 (cationic amino acid transporter, y+ system), member 5 (SLC7A5), mRNA	2E-12
1424	AF035820	Hordeum vulgare gibberellin action negative regulator SPY mRNA, complete cds	2.1

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
1425	AL353672	Human DNA sequence from clone RP1-241K1 on chromosome 6, complete sequence [Homo sapiens]	3.8
1426	AF070565	Homo sapiens clone 24425 mRNA sequence	0.2
1427	AK026914	Homo sapiens cDNA: FLJ23261 fis, clone COL05862	0.009
1428	X14735	Podospora anserina mtDNA for large subunit rRNA	0.21
1429	XM_004081	Homo sapiens aldehyde dehydrogenase 5 family, member A1 (succinate-semialdehyde dehydrogenase) (ALDH5A1), mRNA	1.4
1430	Y10687	Sulfolobus acidocaldarius gene encoding purine NTPase	0.019
1431	AF168678	Drosophila melanogaster adenylyl cyclase 78C-s mRNA, complete cds	0.13
1432	AC006666	Caenorhabditis elegans cosmid H31G24, complete sequence	0.014
1433	X02473	Calf mRNA for delta subunit of muscle acetylcholine receptor	1.1
1434	AF270148	Staphylococcus epidermidis strain SR1 clone step.1051c08 genomic sequence	0.006
1435	XM_008084	Homo sapiens hypothetical protein LOC55565 (LOC55565), mRNA	3E-36
1436	AF007876	Homo sapiens Na,K-ATPase beta 2 subunit gene, complete cds	0.008
1437	AK016592	Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4933400F21, full insert sequence	0.61
1438	AB023053	Homo sapiens genomic DNA, chromosome 6p21.3, HLA class I region, clone:53L9, complete sequence	2E-10
1439	XM_035837	Homo sapiens cAMP responsive element modulator (CREM), mRNA	1.7
1440	Y12710	A.thaliana gene encoding shaggy-like kinase gamma	0.068
1441	AF351620	Homo sapiens lipocalin-1 interacting membrane receptor (LIMR) gene, complete cds	0.028
1442	U67560	Methanococcus jannaschii section 102 of 150 of the complete genome	2.1
1443	NM_002251	Homo sapiens potassium voltage-gated channel, delayed-rectifier, subfamily S, member 1 (KCNS1), mRNA	1.9
1444	XM_027341	Homo sapiens similar to retinoblastoma inhibiting gene 1 (M. musculus) (LOC89932), mRNA	0.0008
1446	AF039373	Arabidopsis thaliana ecotype RLD chromomethylase (CMT1) gene, complete cds	1.9
1447	U29397	Rattus norvegicus plasma membrane Ca ²⁺ ATPase isoform 3 (PMCA3) gene, 5' flanking region	0.008
1448	XM_036536	Homo sapiens hypothetical protein FLJ10402 (FLJ10402), mRNA	4.1
1449	AK000677	Homo sapiens cDNA FLJ20670 fis, clone KAIA4743	1E-09
1450	AJ243538	Glomus mosseae fox2 gene for Fox2 protein	0.018
1451	AJ296103	Staphylococcus aureus repNVH99 gene for replication protein and smr gene	0.23
1452	AF084911	Bombus ternarius cytochrome b gene, partial cds; mitochondrial gene for mitochondrial product	1.4
1453	AC001080	Homo sapiens (subclone 3_g7 from PAC H74) DNA sequence, complete sequence	0.72

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
1454	AF213160	Gallus gallus microsatellite C-MNT-7 sequence	0.019
1455	AB056366	Macaca fascicularis brain cDNA, clone:QflA-14203	0.024
1456	AF129515	Paramecium tetraurelia SEC7-related protein (SEC7) mRNA, complete cds	0.055
1457	XM_037469	Homo sapiens similar to spastic ataxia of Charlevoix-Saguenay (sacsin) (H. sapiens) (LOC91290), mRNA	1.8
1458	AK005404	Mus musculus adult female placenta cDNA, RIKEN full-length enriched library, clone:1600009D24, full insert sequence	4.8
1459	AE001397	Plasmodium falciparum chromosome 2, section 34 of 73 of the complete sequence	4.2

1599	AE001394	Plasmodium falciparum chromosome 2, section 31 of 73 of the complete sequence	2

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
1600	AJ306417	Corynebacterium glutamicum partial nrdF gene for ribonucleotide reductase beta-subunit and ctaD gene for cytochrome aa3 oxidase subunit I	1.9
1601	AF287270	Homo sapiens mucolipin (MCOLN1) gene, complete cds	6
1602	AE002207	Chlamydomophila pneumoniae AR39, section 37 of 94 of the complete genome	0.083
1603	AK003449	Mus musculus 18 days embryo cDNA, RIKEN full-length enriched library, clone:1110004P21, full insert sequence	0.2
1604	AB008103	Arabidopsis thaliana AtERF-1 mRNA for ethylene responsive element binding factor 1, complete cds	0.79
1605	AE006406	Lactococcus lactis subsp. lactis IL1403 section 168 of 218 of the complete genome	0.18
1606	BC008122	Homo sapiens, clone MGC:18053 IMAGE:4148889, mRNA, complete cds	1.5
1607	D28598	Chicken mRNA for c-maf proto-oncogene product c-Maf long form, complete cds	0.44
1608	X97314	M.sativa mRNA for cdc2 kinase homologue, cdc2MsC	1.5
1609	AP001407	Homo sapiens genomic DNA, chromosome 21q22.2, clone:10C6, LB7T-ERG region, complete sequence	1.1
1611	XM_017891	Homo sapiens similar to heterogeneous nuclear ribonucleoprotein L (H. sapiens) (LOC91538), mRNA	1.4
1612	U48562	Corrigiola littoralis ORF2280 gene homolog, chloroplast gene encoding chloroplast protein, partial cds	0.074
1613	XM_036274	Homo sapiens similar to tumor protein p53-binding protein (H. sapiens) (LOC65591), mRNA	2
1614	AJ271039	Plasmodium yoelii yoelii partial mrk gene for MO15-related kinase	0.001
1615	AB016467	Datisca cannabina chloroplast gene for maturase K, partial cds	0.25
1616	AF027807	Homo sapiens beta-casein (CSN2) gene, complete cds	0.074
1617	AK002822	Mus musculus adult male kidney cDNA, RIKEN full-length enriched library, clone:0610039A20, full insert sequence	0.55
1618	U67580	Methanococcus jannaschii section 122 of 150 of the complete genome	0.032
1619	U89140	Mus musculus aldose reductase gene, promoter region and exon 1	0.48
1620	AE002799	Drosophila melanogaster genomic scaffold 142000013385566, complete sequence	0.17
1621	L14855	Bos taurus neurexin I-alpha mRNA, complete cds	0.48
1622	AF379854	Cloning vector pVLH/hsp, complete sequence	2
1623	Z11883	S.tuberosum U1snRNA variant genes U1-1, U1-2, U1-3, U1-4, U1-5 and U1-6	0.54
1624	AJ294727	Mus musculus IL-TIFa gene for IL-TIF alpha protein (IL-22), exons 1a-5	0.011
1625	XM_043073	Homo sapiens hypothetical protein DKFZp434A1319 (DKFZP434A1319), mRNA	1.9

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
1626	M84732	Plasmodium yoelii sporozoite surface protein 2 gene , complete cds	0.007
1627	M83304	G.hirsutum late embryogenesis-abundant protein 2-D (LeaA2-D) mRNA, complete cds	9.8
1628	U32725	Haemophilus influenzae Rd section 40 of 163 of the complete genome	0.14
1629	AF185589	Homo sapiens cytochrome P450 3A4 (CYP3A4) gene, promoter region	0.027
1630	AL591667	Human DNA sequence from clone RP11-389N9 on chromosome 6, complete sequence [Homo sapiens]	0.15
1631	AB058397	Oryza sativa CHS gene for chalcone synthase, complete cds	0.16
1632	M11043	Mouse DNA fragment that hybridizes to HSV-1 SmaI A fragment	1.5
1633	AF145699	Staphylococcus aureus putative membrane protein MprF (mprF) gene, complete cds; and unknown gene	1.5
1634	AF088902	Mus musculus SLIT1 protein (Slit1) mRNA, partial cds	0.5
1635	AB048882	Macaca fascicularis brain cDNA, clone:QnpA-16525	0.21
1636	X98369	M.musculus mRNA for SOX15 protein	0.24
1637	AF131767	Homo sapiens clone 24900 mRNA sequence	0.25
1638	AL117657	Homo sapiens mRNA; cDNA DKFZp586F1924 (from clone DKFZp586F1924)	1.9
1639	AB042973	Nicotiana tabacum wizz gene, 5' flanking region, partial cds	0.072
1640	AJ272083	Staphylococcus aureus empbp gene for extracellular matrix and plasma binding protein, strain SA 113	0.008
1641	BC009423	Homo sapiens, clone MGC:15151 IMAGE:3538202, mRNA, complete cds	1.9
1642	AF114905	Saccharomyces sp. CID1 ATP synthase subunit 8 (ATP8) gene, mitochondrial gene encoding mitochondrial protein, complete cds	0.18
1643	AF270417	Staphylococcus epidermidis strain SR1 clone step.4052d03a genomic sequence	0.063
1644	X91340	G.hybrida chs-like gene	0.51
1645	AF097026	Homo sapiens autosomal highly conserved protein (AHCP) gene, complete cds	0.008
1646	XM_028810	Homo sapiens 67292 (KIAA1755), mRNA	5.5
1647	AL049339	Homo sapiens mRNA; cDNA DKFZp564P046 (from clone DKFZp564P046)	2.1
1648	AE001398	Plasmodium falciparum chromosome 2, section 35 of 73 of the complete sequence	0.13
1649	M55171	Mouse opsin (MOPS) gene, complete cds	0.52
1650	AB008103	Arabidopsis thaliana AtERF-1 mRNA for ethylene responsive element binding factor 1, complete cds	0.66
1651	AL589705	Human DNA sequence from clone RP11-64M7 on chromosome 6, complete sequence [Homo sapiens]	0.5
1652	X79559	T.trypanoides (R1) 18S rRNA gene	0.069
1653	XM_048416	Homo sapiens PRO0478 protein (PRO0478), mRNA	0.0001

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
1654	AF082761	Dasyurus maculatus isolate QM.E1 mitochondrial D-loop, partial sequence	0.063
1655	AF282568	Homo sapiens clone 20ptel_c15bt7 sequence	4E-39
1656	AB027617	Pyrus pyrifolia gene for UDP-glucose pyrophosphorylase, complete cds	0.19
1657	AK023864	Homo sapiens cDNA FLJ13802 fis, clone THYRO1000186	0.2
1658	NM_009905	Mus musculus CDC-like kinase (Clk), mRNA	1.7
1659	AL023846	Caenorhabditis elegans cosmid Y52B11C, complete sequence	2.3
1660	AF334780	Homo sapiens pregnancy-induced growth inhibitor OKL38 gene, partial cds	0.73
1661	XM_042066	Homo sapiens mitogen-activated protein kinase kinase kinase 1 (MAP3K1), mRNA	1.9
1662	XM_034872	Homo sapiens KIAA0202 protein (KIAA0202), mRNA	0.23
1663	AC002252	Homo sapiens (subclone 1_g7 from BAC H76) DNA sequence, complete sequence	3E-14
1664	AK023113	Homo sapiens cDNA FLJ13051 fis, clone NT2RP3001447	2E-20
1665	BC003552	Homo sapiens, calnexin, clone MGC:1196 IMAGE:3546389, mRNA, complete cds	0.076
1666	AF097142	Tapinaspis sp. 12S small subunit ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	1.5
1667	AL117103	Botrytis cinerea strain T4 cDNA library under conditions of nitrogen deprivation	6.1
1668	NM_013825	Mus musculus lymphocyte antigen 75 (Ly75), mRNA	0.74
1669	NM_007043	Homo sapiens HIV-1 rev binding protein 2 (HRB2), mRNA	7E-22
1670	Z27359	G.hirsutum (AD52) copia-like reverse transcriptase fragments	0.24
1671	AK021535	Homo sapiens cDNA FLJ11473 fis, clone HEMBA1001712	0.25
1672	Y00145	Dictyostelium discoideum UDP glucose pyrophosphorylase gene (UDPGP; EC 2.7.7.9)	0.22
1673	M63291	Drosophila silvestris alcohol dehydrogenase gene, complete cds	0.028
1674	AF100401	Influenza B virus B/Guangdong/5/94 segment 8 nonstructural protein (NS1) and nonstructural protein (NS2) genes, complete cds	0.2
1675	U80449	Caenorhabditis elegans cosmid R10A10	1.6
1676	X15634	C. elegans core histone genes H4(his-10) and H3(his-9)	0.022
1677	XM_050366	Homo sapiens zinc finger protein, X-linked (ZFX), mRNA	0.23
1678	AE007046	Mycobacterium tuberculosis CDC1551, section 132 of 280 of the complete genome	0.062
1679	XM_008207	Homo sapiens glucose-6-phosphatase, catalytic (glycogen storage disease type I, von Gierke disease) (G6PC), mRNA	4E-18
1680	AB049118	Hemicentrotus pulcherrimus mRNA for transcription factor HpLim1, complete cds	0.21
1681	XM_002421	Homo sapiens hypothetical protein FLJ20254 (FLJ20254), mRNA	4.1
1682	X96783	H.sapiens Syt V gene (genomic and cDNA sequence)	0.000004

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
1683	U79732	Plasmodium berghei extrachromosomal plastid PB-2, tRNA-Pro, tRNA-Glu, tRNA-Lys, tRNA-Asp, tRNA-Ser, tRNA-Tyr, tRNA-Met, tRNA-Leu, tRNA-Cys, and tRNA-His genes, complete sequence, rps4 gene, complete cds, tRNA-Thr gene, complete sequence, and large subu>	0.001
1684	NC_002619	Pteropus scapulatus mitochondrion, complete genome	6.3
1685	L16679	Caenorhabditis elegans cosmid K07D8, complete sequence	1.8
1686	Y08924	P.falciparum mRNA for AARP2 protein	0.003

1790	AJ236640	Homo sapiens chromosome 22 CpG island DNA, genomic MseI fragment, clone 22CGIB49A20, complete read	9E-19
1791	XM_041751	Homo sapiens discoidin domain receptor family, member 1 (DDR1), mRNA	3.5
1792	AL034546	Human DNA sequence from clone RP5-898I4 on chromosome 22q13.33 Contains a GSS and a putative CpG island, complete sequence [Homo sapiens]	0.000005
1793	AJ006873	Buchnera aphidicola plasmid pBUs1, repA2 gene, leuA gene and ORF1	0.23

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
1794	X79779	<i>S.tuberosum</i> KST1 mRNA	0.67
1795	AF371373	<i>Cricetulus griseus</i> hypothetical protein A1-3 mRNA, complete cds	0.61
1796	AF165082	<i>Pollachius virens</i> cytochrome b gene, partial cds; mitochondrial gene for mitochondrial product	0.53
1797	AE007418	<i>Streptococcus pneumoniae</i> section 101 of 194 of the complete genome	0.027
1798	X67082	<i>H.sapiens</i> AMBP gene transcription regulatory region	0.006
1799	AL117655	<i>Homo sapiens</i> mRNA; cDNA DKFZp586E2024 (from clone DKFZp586E2024)	5.2
1800	AB048972	<i>Macaca fascicularis</i> brain cDNA, clone:QnpA-12040	0.53
1801	XM_030865	<i>Homo sapiens</i> M-phase phosphoprotein 10 (U3 small nucleolar ribonucleoprotein) (MPHOSPH10), mRNA	0.18
1802	AF123488	South River virus polyprotein mRNA, complete cds	0.49
1803	AB027590	<i>Pachliopta aristolochiae</i> mitochondrial mRNA for NADH dehydrogenase subunit 5, partial cds	0.024
1804	J00889	Chicken cellular myc proto-oncogene, complete cds	0.008
1805	XM_030024	<i>Homo sapiens</i> similar to protein kinase C binding protein 1 (<i>H.sapiens</i>) (LOC90218), mRNA	0.009
1806	AB023486	<i>Homo sapiens</i> gene for histamine H2 receptor, promoter region and complete cds	0.064
1807	D21196	<i>Dictyostelium discoideum</i> mitochondrial DNA	0.21
1808	AY035029	<i>Arabidopsis thaliana</i> putative dihydroorotate dehydrogenase (MEB5.3/AT3g17810) mRNA, complete cds	5.3
1809	AB047389	<i>Clostridium difficile</i> purL gene for formylglycinamide ribonucleotide synthetase (FGAM synthetase), complete cds	0.019
1810	AK012033	<i>Mus musculus</i> 10 days embryo cDNA, RIKEN full-length enriched library, clone:2610315E15, full insert sequence	2.2
1811	AF044202	<i>Drosophila melanogaster</i> glutamate receptor DGluRIIB mRNA, complete cds	0.008
1812	AK026967	<i>Homo sapiens</i> cDNA: FLJ23314 fis, clone HEP11989	0.66
1813	AB050432	<i>Macaca fascicularis</i> brain cDNA, clone:QnpA-21861	0.4
1814	X16871	Human DNA for elongation factor 1-alpha (clone lambda-4)	4.7
1815	AE000001	<i>Mycoplasma pneumoniae</i> M129 section 16 of 63 of the complete genome	1.9
1816	AK002671	<i>Mus musculus</i> adult male kidney cDNA, RIKEN full-length enriched library, clone:0610025N14, full insert sequence	0.052
1817	AF202903	<i>Sporopachydermia cereana</i> var. D77-321B internal transcribed spacer 1, 5.8S ribosomal RNA gene and internal transcribed spacer 2, complete sequence; and large subunit ribosomal RNA gene, partial sequence	0.5
1819	L42167	<i>Mus musculus</i> (clone R24) rds gene, partial cds	0.16
1820	XM_027078	<i>Homo sapiens</i> ATPase, Class V, type 10D (ATP10D), mRNA	0.16
1821	L27619	<i>Macaca nemestrina</i> T-cell receptor beta chain V region (Vb15.1) gene, partial cds	0.016

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
1822	BC003900	Mus musculus, Similar to hypothetical protein 384D8_6, clone MGC:6766 IMAGE:3601298, mRNA, complete cds	0.51
1823	XM_050561	Homo sapiens KIAA0700 protein (KIAA0700), mRNA	0.51
1824	S66407	FLT4=receptor tyrosine kinase isoform FLT4 long {3' region, alternatively spliced} [human, mRNA Partial, 216 nt]	8E-36
1825	AY008805	Equus caballus retinoblastoma (RB1) gene, partial cds	0.058
1826	AJ276629	Rattus norvegicus Sacm21/RT1-A intergenic region, haplotype RT1n and partial RT1-A gene for MHC Class I antigen	3.7
1827	AF029975	Eucalyptus grandis MADS box protein (EGM1) mRNA, complete cds	1.2
1828	AL109708	Homo sapiens mRNA full length insert cDNA clone EUROIMAGE 254679	0.019
1829	AF270353	Staphylococcus epidermidis strain SR1 clone step.4025a02 genomic sequence	0.051
1831	U72236	Dictyostelium discoideum ModA (modA) gene, complete cds	0.5
1832	L15234	Mycoplasma pneumoniae Cys-tRNA, Pro-tRNA, Met-tRNA, Ile-tRNA, Ser-tRNA, fMet-tRNA, Asp-tRNA and Phe-tRNA genes	1.1
1833	XM_012722	Homo sapiens RNA (guanine-7-) methyltransferase (RNMT), mRNA	0.5
1834	AF108228	Ginkgo biloba GinLFY protein (GinLFY) gene, complete cds	4.2
1836	XM_049943	Homo sapiens topoisomerase (DNA) II alpha (170kD) (TOP2A), mRNA	0.47
1837	NC_002674	Aulopus japonicus mitochondrion, complete genome	3.1
1838	AE001399	Plasmodium falciparum chromosome 2, section 36 of 73 of the complete sequence	0.008
1839	U53695	Leishmania enriettii multidrug resistance (lemdr1) gene, 5' UTR	0.5
1840	AF257022	Salmo salar clone BHMS7-009 microsatellite sequence	0.7
1841	AF239571	Acineta superba tRNA-Leu (trnL) gene, partial sequence; and trnL-F intergenic spacer region, complete sequence; chloroplast gene for chloroplast product	5.4
1842	AL032651	Caenorhabditis elegans cosmid Y6D1A, complete sequence	0.019
1844	XM_034229	Homo sapiens similar to hypothetical protein FLJ14260 (H. sapiens) (LOC90803), mRNA	0.068
1845	AL137121	Human DNA sequence from clone RP11-122K21 on chromosome 13, complete sequence [Homo sapiens]	e-147
1846	AF137535	Danio rerio clone Dare-DAXX DAXX protein mRNA, partial cds	1.7
1847	AK023539	Homo sapiens cDNA FLJ13477 fis, clone PLACE1003638	0.21
1848	AF218799	Gallus gallus clone LDH-BT1 lactate dehydrogenase B mRNA, complete cds	6.4
1849	AF250345	Xenopus laevis early growth response protein mRNA, complete cds	0.52
1850	BC006858	Mus musculus, clone IMAGE:3594635, mRNA	1.5
1852	XM_006782	Homo sapiens cyclin T1 (CCNT1), mRNA	0.092
1853	J03883	Rabbit zeta-1 globin processed pseudogene, complete cds	1.5

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
1854	AF349951	Homo sapiens HP95 mRNA, complete cds	3E-09
1855	AF268062	Candidatus Carsonella ruddii natural-host Bactericera cockerelli RNA polymerase beta subunit (rpoB) and RNA polymerase beta-prime subunit (rpoC) genes, partial cds	0.17
1856	AF114508	Uncultured gamma proteobacterium SUR-ATT-8 16S ribosomal RNA gene, complete sequence	1.5
1857	AE006785	Sulfolobus solfataricus section 144 of 272 of the complete genome	0.091
1858	AF078684	Psoroptes ovis glutathione S-transferase mRNA, complete cds	0.0006
1859	BC004671	Mus musculus, FK506 binding protein 1a (12 kDa), clone MGC:6253 IMAGE:3498682, mRNA, complete cds	0.12
1860	NM_025083	Homo sapiens hypothetical protein FLJ21128 (FLJ21128), mRNA	e-121
1861	BC004161	Homo sapiens, transmembrane 4 superfamily member (tetraspan NET-7), clone MGC:2447 IMAGE:2958221, mRNA, complete cds	0.051
1862	BC009855	Homo sapiens, Similar to nucleolin, clone MGC:16354 IMAGE:3926227, mRNA, complete cds	e-171
1863	AK016507	Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4931439C15, full insert sequence	0.019
1864	AF334756	Homo sapiens interleukin-1 HY2 (IL1HY2) gene, complete cds	1.5
1865	Z68881	Human DNA sequence from cosmid L118G10, Huntington's Disease Region, chromosome 4p16.3	0.005
1866	AJ277737	Homo sapiens partial POLR2J2 gene for RPB11b1 protein, intron 4 (1824 BP)	0.0000001
1867	XM_051572	Homo sapiens heat shock transcription factor 2 (HSF2), mRNA	1E-11
1868	AF256918	Salmo salar clone BHMS267 microsatellite sequence	0.11
1869	AE000557	Helicobacter pylori 26695 section 35 of 134 of the complete genome	0.17
1870	XM_050469	Homo sapiens ferritin, light polypeptide (FTL), mRNA	0.081
1871	XM_042818	Homo sapiens homeo box D4 (HOXD4), mRNA	0.24
1872	AB035093	Petunia x hybrida mRNA for lateral shoot inducing factor, complete cds	1.9
1873	AE006184	Pasteurella multocida PM70 section 151 of 204 of the complete genome	5.6

1976	AE001402	Plasmodium falciparum chromosome 2, section 39 of 73 of the complete sequence	0.026
1977	XM_001935	Homo sapiens forkhead box D2 (FOXD2), mRNA	2.1
1978	AL590384	Human DNA sequence from clone RP11-349A16 on chromosome Xq22.3-24, complete sequence [Homo sapiens]	0.008
1979	AL117050	Botrytis cinerea strain T4 cDNA library under conditions of nitrogen deprivation	2.2
1980	XM_037529	Homo sapiens KIAA0410 gene product (KIAA0410), mRNA	2.3
1981	X56212	C.elegans gene for vitellogenin	1.8

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
1982	AF231684	Drosophila melanogaster outstretched (os) gene, complete cds	0.7
1983	AB032264	Danio rerio mRNA for glycogen synthase kinase 3 alpha, complete cds	2.2
1984	AK022877	Homo sapiens cDNA FLJ12815 fis, clone NT2RP2002546	0.009
1985	U89140	Mus musculus aldose reductase gene, promoter region and exon 1	0.69
1986	M37036	Rat nucleolar proteins B23.1 and B23.2	0.086
1987	XM_035498	Homo sapiens amiloride-sensitive cation channel 2, neuronal (ACCN2), mRNA	0.25
1988	U40944	Caenorhabditis elegans cosmid PDB1, complete sequence	0.025
1989	AF102762	Dasylagon n. sp. 'Mardulyn & Whitfield' 16S large subunit ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.24
1990	AF247631	Maoricicada iolanthe cytochrome oxidase subunit I (COI) gene, partial cds; mitochondrial gene for mitochondrial product	0.026
1991	Z81538	Caenorhabditis elegans cosmid F45H10, complete sequence	6.2
1992	Z72516	Caenorhabditis elegans cosmid T25G3, complete sequence	0.75
1993	AE002201	Chlamydomonas reinhardtii AR39, section 32 of 94 of the complete genome	6.6
1994	NM_003816	Homo sapiens a disintegrin and metalloproteinase domain 9 (meltrin gamma) (ADAM9), mRNA	2E-17
1995	AL158132	Human DNA sequence from clone RP3-323A24 on chromosome 4. Contains GSSs and a putative CpG island, complete sequence [Homo sapiens]	0.074
1996	NM_023122	Mus musculus glycoprotein m6b (Gpm6b), mRNA	5.7
1997	AF014502	Glycine max seed coat peroxidase precursor (Ep) gene, complete cds	1.8
1998	AJ270226	Entodinium caudatum partial mRNA for putative glycosyltransferase, clone L48	2.1
1999	AF159913	Euplotes crassus transposon Tec1 clone Tec1-2 orf 2 and orf 3 pseudogenes, complete sequence	0.011
2000	AF101309	Caenorhabditis elegans cosmid H24G06, complete sequence	2.2
2001	AB021240	Hypseleotris compressus mitochondrial gene for Cytochrome b, complete cds	0.022
2002	AC078798	Homo sapiens 3 BAC PAC-56F11 (Roswell Park Cancer Institute Human BAC Library) complete sequence	0.001
2003	AK021504	Homo sapiens cDNA FLJ11442 fis, clone HEMBA1001327	0.76
2004	AF314531	Chilli leaf curl virus A component, complete sequence	0.23
2005	XM_047794	Homo sapiens KIAA1641 protein (KIAA1641), mRNA	e-123
2006	AC079136	Homo sapiens clone RP11-153L12, complete sequence	0.65
2007	AE001422	Plasmodium falciparum chromosome 2, section 59 of 73 of the complete sequence	0.001
2009	AJ306692	Drosophila virilis ORF1, rpL14 gene and ORF2	0.26
2010	AC084242	Arabidopsis thaliana chromosome 1 BAC T24P22 genomic sequence, complete sequence	0.72

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
2011	Z16768	H. sapiens (D12S90) DNA segment containing (CA) repeat; clone AFM172xd8; single read	0.058
2012	AF311633	Eimeria nieschulzi ORF470 gene, partial cds; apicoplast gene for apicoplast product	1.9
2013	XM_012933	Homo sapiens hypothetical protein FLJ11656 (FLJ11656), mRNA	2.5
2014	AB035190	Homo sapiens RHD gene, intron 2, complete sequence	1.6
2015	NC_002135	Pleurotus ostreatus mitochondrial plasmid mlp1, complete sequence	0.22
2016	AF085619	Elgaria paucicarinata NADH dehydrogenase subunit I (ND1) gene, partial cds; tRNA-Ile, tRNA-Gln, and tRNA-Met genes, complete sequence; NADH dehydrogenase subunit II (ND2) gene, complete cds; tRNA-Trp, tRNA-Ala, tRNA-Asn, tRNA-Cys, and tRNA-Tyr genes, <>	2.3
2017	D85424	Homó sapiens gene for alphaS1-casein, 5'flanking region	0.077
2018	AE001138	Borrelia burgdorferi (section 24 of 70) of the complete genome	0.026
2019	BC007114	Homo sapiens, clone IMAGE:4295422, mRNA	0.23
2020	AF080510	Homo sapiens mannose-binding protein gene, exon 4 and complete cds	0.00001
2022	XM_027941	Homo sapiens hypothetical protein DKFZp761J139 (DKFZp761J139), mRNA	0.003
2023	Z68996	H.sapiens mRNA for immunoglobulin kappa light chain VJ region (ID POM021)	0.15
2024	AB049191	Mus musculus DNA, clone:lambda4/6, endogenous mouse mammary tumor virus LTR region	0.15
2025	U62057	Mycoplasma capricolum NADH oxidase (naox) gene, partial cds, and lipoate-protein ligase (lpla), pyruvate dehydrogenase EI alpha subunit (odpa), pyruvate dehydrogenase EI beta subunit (odpb), pyruvate dehydrogenase EII (odp2), dihydrolipoamide dehydroge>	3
2026	AY018527	Oryza sativa microsatellite MRG0852 containing (AT)X17, genomic sequence	0.0003
2027	AF266084	Phyllopetalia apicalis large subunit ribosomal RNA gene, partial sequence; tRNA-Valine gene, complete sequence; and small subunit ribosomal RNA gene, partial sequence; mitochondrial genes for mitochondrial products	0.009
2028	AF249912	Cucumis melo galactinol synthase (GAS1) gene, upstream sequence and partial cds	0.021
2029	XM_048172	Homo sapiens hypothetical protein DKFZp434F1017 (DKFZP434F1017), mRNA	6.5
2030	AF367436	Erysimum cheiri chloroplast outer envelope membrane protein mRNA, complete cds	1.2
2031	AF135026	Homo sapiens kallikrein-like protein 3 (KLK9) gene, complete cds, alternatively spliced	0.76
2032	Z69782	A.thermophilum xylR gene, xynA gene and alfa gene	0.0004

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
2033	NM_013730	Mus musculus signaling lymphocyte activation molecule (Slam), mRNA	6.4
2034	NC_002811	Tarsius bancanus mitochondrion, complete genome	0.69
2035	AF184822	Arabidopsis thaliana inhibitor tagged site ITS55 genomic sequence	0.24
2036	AE006626	Streptococcus pyogenes M1 GAS strain SF370, section 155 of 167 of the complete genome	5.4
2037	AF324424	Ichthyophthirius multifiliis immobilization antigen isoform (IAG52A) gene, complete cds	0.003
2038	AL391223	Human chromosome 14 DNA sequence Partial sequence from BAC R-325N7_PCR1 of library RPCI-11 from chromosome 14 of Homo sapiens (Human), complete sequence	6.3
2040	AF369348	Rabies virus V231.RB phosphoprotein (P) gene, complete cds	1.4
2041	AF023666	Apis mellifera sn-glycerol-3-phosphate dehydrogenase (Gpdh) gene, complete cds	0.25
2042	XM_011553	Homo sapiens aldo-keto reductase family 1, member D1 (delta 4-3-ketosteroid-5-beta-reductase) (AKR1D1), mRNA	0.001
2043	XM_004530	Homo sapiens nuclear receptor subfamily 2, group E, member 1 (NR2E1), mRNA	5E-41
2044	AJ277602	Gallus gallus partial mRNA for initiation of translation factor 2 (cif2 gene)	0.72
2045	XM_041537	Homo sapiens echinoderm microtubule-associated protein-like (EMAPL), mRNA	1.7
2046	AE001429	Plasmodium falciparum chromosome 2, section 66 of 73 of the complete sequence	0.57
2047	L03188	Saccharomyces cerevisiae integrin analogue gene, complete cds	0.23
2048	XM_034810	Homo sapiens similar to ALU SUBFAMILY SQ SEQUENCE CONTAMINATION WARNING ENTRY (H. sapiens) (LOC90908), mRNA	2E-25
2049	AE006570	Streptococcus pyogenes M1 GAS strain SF370, section 99 of 167 of the complete genome	0.64
2050	AY023977	Oryza sativa microsatellite MRG6302 containing (ATTA)X6, closest to marker R1674, genomic sequence	0.6
2051	M91384	Dictyostelium discoideum thioredoxin (TRX1) mRNA, complete cds	0.68
2052	XM_032748	Homo sapiens KIAA1634 protein (KIAA1634), mRNA	0.066
2053	AB004814	Oryza sativa DNA for NLS receptor, complete cds	0.009
2054	AF130049	Homo sapiens clone FLB3411 PRO0852 mRNA, complete cds	0.078
2055	Y19213	Homo sapiens putative psihHbA pseudogene for hair keratin, exons 2 to 7	0.038
2056	AF305146	Picea abies clone 1PABCA3F hypomethylated genomic sequence	1.8
2057	Z67997	Human DNA sequence from cosmid L206D7, Huntington's Disease Region, chromosome 4p16.3	0.0001
2058	U51024	Human Down Syndrome region of chromosome 21 DNA	0.0008
2059	AC092063	Homo sapiens clone RP11-745H7, complete sequence	0

2168	AL133397	Human DNA sequence from clone RP1-213J1p on chromosome 22q11.21-12.2, complete sequence [Homo sapiens]	0.039
2169	AL157423	Homo sapiens mRNA; cDNA DKFZp761O0511 (from clone DKFZp761O0511)	7E-15
2170	AF282578	Homo sapiens clone 20ptel_c1622_12_3.3f sequence	9E-17
2171	AB022280	Oryzias latipes gene for soluble guanylyl cyclase alpha subunit, complete cds	3.7
2172	AF052744	Homo sapiens transcriptional repressor p54 gene, promoter region and partial cds	2
2173	XM_007685	Homo sapiens MAGE-like 2 (MAGEL2), mRNA	0.008
2174	AK019539	Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4921514G21, full insert sequence	1.6
2175	AE007472	Streptococcus pneumoniae section 155 of 194 of the complete genome	6.2
2176	AL162381	Human DNA sequence from clone RP11-174B19 on chromosome 6, complete sequence [Homo sapiens]	0.059

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
2177	M21836	Mouse extra-embryonic endodermal cytokeratin type II (EndoA) mRNA, complete cds	e-138
2178	X06292	Human c-fes/fps proto-oncogene	1.7
2179	AF360278	Arabidopsis thaliana putative MLH1 protein (AT4g09140) mRNA, complete cds	0.0001
2180	X78548	G.max gene encoding epoxide hydrolase	0.68
2181	Z56222	H.sapiens CpG island DNA genomic MseI fragment, clone 97b6, reverse read cpg97b6.rt1a	5E-60
2182	AF200412	Wiebesia brusi cytochrome oxidase subunit I (COD) gene, partial cds; tRNA-Leu gene, complete sequence; and cytochrome oxidase subunit II (COII) gene gene, partial cds; mitochondrial genes for mitochondrial products	0.084
2183	AF360327	Arabidopsis thaliana putative metal-binding protein (MLE2.16/AT5g63530) mRNA, complete cds	0.014
2184	XM_005837	Homo sapiens CUG triplet repeat, RNA-binding protein 2 (CUGBP2), mRNA	0.22
2185	BC008152	Mus musculus, caspase 1, clone MGC:6106 IMAGE:3583883, mRNA, complete cds	1.9
2186	U41289	Dictyostelium discoideum K7 kinesin-like protein mRNA, complete cds	0.66
2187	AF163863	Mustela vison tyrosine aminotransferase gene, complete cds	0.23
2188	XM_017198	Homo sapiens hypothetical protein FLJ12085 (FLJ12085), mRNA	4E-36
2189	D16180	Human PMP2 gene for peripheral myelin protein 2, exon 2 and 3	0.68
2190	AB037920	Clostridium botulinum genes for ORF-22, HA-70, HA-17, HA-33, NTNHA, neurotoxin, complete cds	0.083
2191	AE006703	Sulfolobus solfataricus section 62 of 272 of the complete genome	1.6
2192	AB047401	Periplaneta americana Vg-2 mRNA for vitellogenin-2, complete cds	0.25
2193	U11491	Human rotavirus M37 non-structural protein NSP1 mRNA, complete cds	0.17
2194	AF338818	Mus musculus flavohemoprotein b5/b5R mRNA, complete cds	2.3
2195	AP001290	Mus musculus genomic DNA, chromosome 7, clone:B118_5, complete sequence	0.56
2196	XM_010940	Homo sapiens putative GR6 protein (GR6), mRNA	2E-61
2197	AF119554	Plasmodium falciparum para-aminobenzoic acid synthetase gene, complete cds	0.009
2198	AY035995	Streptococcus pneumoniae strain SPN1506 topoisomerase IV subunit A (parC) gene, complete cds	1.2
2199	XM_006892	Homo sapiens cAMP responsive element binding protein-like 2 (CREBL2), mRNA	0.049
2200	X87127	Borrelia burgdorferi repeated DNA element, 30.5 kb circular plasmid copy	0.46
2201	AB010958	Clostridium thermocellum xynA and xynB genes for xylanase, complete cds	0.23

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
2202	AE003004	Drosophila melanogaster genomic scaffold 142000013385492, complete sequence	0.23
2203	U63418	Mus musculus uncoupling protein (Ucp) gene, nuclear gene encoding mitochondrial protein, complete cds	0.23
2204	AJ243265	Homo sapiens partial PGM1 gene for phosphoglucomutase 1, exons 5-7	e-135
2205	X13883	Yersinia pseudotuberculosis virulence plasmid pIBI yopA gene for Yop1 protein	2.1
2206	XM_011639	Homo sapiens KIAA0535 gene product (KIAA0535), mRNA	8E-22
2207	AF098990	Caenorhabditis elegans cosmid H35N03	2.2
2208	AB037920	Clostridium botulinum genes for ORF-22, HA-70, HA-17, HA-33, NTNHA, neurotoxin, complete cds	0.2
2209	AB053087	Human immunodeficiency virus type 1 pol gene, reverse transcriptase amino terminal part, partial cds, 99JP-NH3-II plasma virus clone:NH3RT-V3-2-9	0.028
2210	NM_008989	Mus musculus purine rich element binding protein A (Pura), mRNA	0.028
2211	U97291	Equus caballus random genomic clone JH226	0.008
2212	AK001699	Homo sapiens cDNA FLJ10837 fis, clone NT2RP4001260, highly similar to Homo sapiens mRNA for KIAA0875 protein	0.016
2213	U84532	Human dystrobrevin (DTN) gene, exon 4	0.23
2214	Z54522	H.sapiens CpG island DNA genomic MseI fragment, clone 12b6, forward read cpg12b6.flc	1.5
2215	Z69666	Human DNA sequence from cosmid 24F8 from a contig from the tip of the short arm of chromosome 16, spanning 2Mb of 16p13.3. Contains ESTs, repeat polymorphism and CpG island	6.5
2216	M69205	Ockelbo virus complete genome	2.2
2217	AF202552	Homo sapiens DNA methyltransferase (DNMT1) gene, exons 2, 3, and 4	0.24
2218	D16541	Chicken DNA for connectin(titin), partial sequence	0.064
2220	AC023351	Homo sapiens clone RP11-637J20, complete sequence	1E-59
2221	AL512305	Human DNA sequence from clone RP11-85E24 on chromosome 6, complete sequence [Homo sapiens]	0.002
2222	U67581	Methanococcus jannaschii section 123 of 150 of the complete genome	5
2223	AE007428	Streptococcus pneumoniae section 111 of 194 of the complete genome	1.9
2224	AK023601	Homo sapiens cDNA FLJ13539 fis, clone PLACE1006640	1.7
2225	AF375468	Homo sapiens endothelial protein C receptor (PROCR) gene, complete cds	0.016
2226	AF350726	Symphyglossum sanguineum chloroplast tRNA-Leu (trnL) gene and trnL-trnF intergenic spacer, partial sequence	1.4
2227	NM_008308	Mus musculus 5-hydroxytryptamine (serotonin) receptor 1A (Htr1a), mRNA	0.23
2228	Z62421	H.sapiens CpG island DNA genomic MseI fragment, clone 68h2, forward read cpg68h2.fl1a	4E-68

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
2229	AF210834	Homo sapiens HARP (HARP) gene, exons 3 and 4	0.008
2230	L81672	Homo sapiens (subclone 2_b12 from P1 H49) DNA sequence, complete sequence	0.13
2231	XM_008431	Homo sapiens integrin, alpha 3 (antigen CD49C, alpha 3 subunit of VLA-3 receptor) (ITGA3), mRNA	1.8
2232	AE006295	Lactococcus lactis subsp. lactis IL1403 section 57 of 218 of the complete genome	0.19
2233	U39693	Mycoplasma genitalium section 15 of 51 of the complete genome	0.21
2234	AL032629	Caenorhabditis elegans cosmid Y102F5A, complete sequence	0.46
2235	AF029114	Ascogaster sp. 16S ribosomal RNA gene, mitochondrial gene for mitochondrial RNA, partial sequence	0.076
2236	AF150036	Hyalomma dromedarii 12S small ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.63
2237	AF013711	Homo sapiens 22 kDa actin-binding protein (SM22) gene, complete cds	0.6
2238	XM_035961	Homo sapiens hypothetical protein FLJ10849 (FLJ10849), mRNA	0.77
2239	AJ290957	Drosophila erecta partial eIF2g gene for eukaryotic translation initiation factor 2 gamma and Su(var)3-9 gene for heterochromatin protein	0.24
2240	AF282004	Homo sapiens clone 15qtel_c366at7 sequence	8.2
2241	AF104915	Plasmodium falciparum protein serine/threonine kinase-1 (psk1) gene, complete cds	0.009
2242	M22064	Mouse MHC class I Lyt-2-a gene encoding lyt-2.1 T-cell surface alloantigen, complete cds	0.049
2243	AF265368	Hypseleotris compressa 12S ribosomal RNA gene, complete sequence; mitochondrial gene for mitochondrial product	0.21
2245	AE001397	Plasmodium falciparum chromosome 2, section 34 of 73 of the complete sequence	0.024
2246	AK004676	Mus musculus adult male lung cDNA, RIKEN full-length enriched library, clone:1200009I24, full insert sequence	0.56
2247	XM_002436	Homo sapiens sterile-alpha motif and leucine zipper containing kinase AZK (ZAK), mRNA	0.67
2248	AE006324	Lactococcus lactis subsp. lactis IL1403 section 86 of 218 of the complete genome	0.47
2249	XM_042833	Homo sapiens KIAA0295 protein (KIAA0295), mRNA	5.1
2250	X63412	B.burgdorferi plasmid ospA gene for outer surface protein A	0.36
2251	AK024235	Homo sapiens cDNA FLJ14173 fis, clone NT2RP2002755	1.8
2252	U69826	Eryx miliaris nogajorum cytochrome b (cytb) gene, mitochondrial gene encoding mitochondrial protein, partial cds	5.9
2254	AF038086	HIV-1 isolate TZB0036 from Tanzania, gp120 C2-C4 region (env) gene, partial cds	0.077
2255	AF317082	Adoncholaimus thalassophygas isolate Sou39 large subunit ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.003
2256	NM_005386	Homo sapiens neuronatin (NNAT), mRNA	0.6

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
2257	XM_037301	Homo sapiens hypothetical protein FLJ12697 (FLJ12697), mRNA	2E-61
2258	XM_028046	Homo sapiens KIAA0220 protein (KIAA0220), mRNA	5E-61
2259	U94520	Lactococcus lactis plasmid pND861 abortive phage resistance proteins (abiLi) and (abiLii) genes, complete cds	0.81
2260	U00037	Caenorhabditis elegans cosmid T20H4	0.081
2261	Z74866	S.cerevisiae chromosome XV reading frame ORF YOL124c	0.55
2262	Z92779	Caenorhabditis elegans cosmid C44E1, complete sequence	0.7
2263	V00694	Saccharomyces cerevisiae mitochondrion COX/OXI3 gene encoding for cytochrome oxidase subunit 1	0.021
2264	AC010728	Homo sapiens BAC clone RP11-258E22 from Y, complete sequence	3E-30
2265	AJ406392	Beta vulgaris partial En/Spm-like transposon, clone 44.9	0.054
2266	AE001430	Plasmodium falciparum chromosome 2, section 67 of 73 of the complete sequence	0.064
2267	AF378270	Pangasius sp. ZZSH-2001 microsatellite PSP-G 456 sequence	1.1
2268	XM_047227	Homo sapiens hypothetical gene supported by AL122112 (LOC92776), mRNA	0.38
2269	AE002758	Drosophila melanogaster genomic scaffold 142000013385931, complete sequence	0.2
2270	AL115861	Botrytis cinerea strain T4 cDNA library under conditions of nitrogen deprivation	0.14

2378	X02870	Bovine gene for cytokeratin Vtb	0.053
2379	AL590157	Human DNA sequence from clone RP13-420K18 on chromosome X, complete sequence [Homo sapiens]	4E-08
2380	AF282242	Plasmodium falciparum strain Dd2 chloroquine resistance marker protein gene, complete cds	4.2
2381	Z24745	A.thaliana 2S albumin gene isoforms 1 and 2, complete CDS's	0.6

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
2382	AL035418	Human DNA sequence from clone RP1-141I3 on chromosome 22q13.1-13.33 Contains a GSS, complete sequence [Homo sapiens]	1.6
2383	Y17968	Gallus gallus mRNA for high mobility group 1 protein	1.5
2384	XM_034735	Homo sapiens similar to hypothetical protein FLJ21463 (H. sapiens) (LOC90883), mRNA	5.6
2385	AF001415	Arabidopsis thaliana 14-3-3-like protein GF14 upsilon (GRF5) gene, complete cds	1.3
2386	XM_009026	Homo sapiens retinol dehydrogenase 8 (all-trans) (RDH8), mRNA	1.9
2387	XM_003095	Homo sapiens zinc finger protein 288 (ZNF288), mRNA	1.8
2388	AE003083	Drosophila melanogaster genomic scaffold 142000013385449, complete sequence	0.51
2389	AE002798	Drosophila melanogaster genomic scaffold 142000013385466, complete sequence	0.018
2390	AL359506	Human DNA sequence from clone CTD-2007A7 on chromosome 20. Contains GSSs, complete sequence [Homo sapiens]	0.28
2391	U32726	Haemophilus influenzae Rd section 41 of 163 of the complete genome	0.3
2392	AB010468	Cyprinus carpio mRNA for CXC chemokine receptor-1, complete cds	0.9
2393	AE006886	Sulfolobus solfataricus section 245 of 272 of the complete genome	0.19
2394	M19810	Human apolipoprotein B-100 (apoB) gene, exon 4	0.43
2395	AB005548	Homo sapiens gene for squamous cell carcinoma antigen 2, partial cds	0.0004
2396	AJ318337	Plasmodium falciparum krueppel1 gene for Krueppel-like protein	0.62
2397	U01102	Human lung Clara cells 10 kda secretory protein (CC10) gene, satellite and Alu repeat sequences, complete cds	3.8
2398	AK017766	Mus musculus 8 days embryo cDNA, RIKEN full-length enriched library, clone:5730512J02, full insert sequence	1.7
2399	AE000032	Mycoplasma pneumoniae M129 section 48 of 63 of the complete genome	0.55
2400	AF333234	Homo sapiens receptor activator of nuclear factor kappa B ligand (RANKL) gene, promoter region	0.22
2401	BC010652	Homo sapiens, clone MGC:9753 IMAGE:3855206, mRNA, complete cds	1.8
2402	AK007856	Mus musculus 10 day old male pancreas cDNA, RIKEN full-length enriched library, clone:1810054D07, full insert sequence	2E-94
2403	AF172723	Homo sapiens integrin alpha 10 subunit (ITGA10) gene, exons 7 through 17 and partial cds	0.21
2404	NM_026570	Mus musculus glioma-amplified sequence-41 (Gas41-pending), mRNA	1.1
2405	U78770	Mus musculus spasmodic polypeptide (mSP) gene, complete cds	1.8

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
2406	U26729	Human neprilysin gene, non-coding exon 3	0.92
2407	AE006346	Lactococcus lactis subsp. lactis IL1403 section 108 of 218 of the complete genome	2
2408	AF258783	Felis catus Niemann-Pick type C1 disease protein (NPC1) mRNA, complete cds	0.23
2409	AC007280	Homo sapiens BAC clone RP11-332C7 from 7p11.2-p21, complete sequence	0.39
2410	D13065	Mycoplasma capricolum mcs4 gene for MCS4 RNA	0.062
2411	AF196058	Drosophila pseudoobscura strain PSU606 period (per) gene, intron 4, partial sequence	1.5
2412	AF370534	Arabidopsis thaliana Putative L-ascorbate peroxidase (AT4g09010) mRNA, complete cds	1.8
2413	AF084197	Pongo pygmaeus gamma-aminobutyric acid receptor A5 subunit duplicated gene, 5'UTR region	0.00009
2414	Y17045	Plasmodium falciparum gltS gene	0.063
2415	AL021177	Caenorhabditis elegans cosmid Y1A5A, complete sequence	0.22
2416	AJ238847	Drosophila melanogaster mRNA for drosophila dodeca-satellite protein 1 (DDP-1)	0.22
2417	AB056333	Macaca fascicularis brain cDNA, clone:QfIA-13486	e-126
2418	AF104821	Danio rerio Hlx2 gene, promoter region	0.056
2419	AF138960	Neospora caninum ycf24 protein (ycf24) gene, partial cds; DNA dependent RNA polymerase beta subunit (rpoB) gene, complete cds; and DNA dependent RNA polymerase beta subunit' (rpoC1) gene, partial cds, plastid genes for plastid products	0.21
2420	AF338712	Emeus crassus mitochondrion, partial genome	1.3
2421	Z82625	R.prowazekii genomic DNA fragment (clone A396F)	0.46
2422	XM_015945	Homo sapiens hypothetical protein FLJ13842 (FLJ13842), mRNA	6E-62
2423	X57010	Human COL2A1 gene for collagen II alpha 1 chain, exons E2-E15	0.63
2424	AF283525	Homo sapiens FIP2 gene, exons 11, 12 and 13	4E-71
2425	AK013530	Mus musculus adult male hippocampus cDNA, RIKEN full-length enriched library, clone:2900012M01, full insert sequence	5.3
2426	D86077	Homo sapiens DNA for cyclin G, partial cds	0.02
2427	X94208	H.sapiens TPR gene (1121bp)	0.19
2428	AF211528	Nicotiana tabacum Avr9/Cf-9 rapidly elicited protein 4 (ACRE4) mRNA, complete cds	0.22
2430	L35688	Homo sapiens (subclone H9 10_d10 from P1 LBL#3) DNA sequence	5E-08
2431	U59711	Cavia porcellus seminal vesicle secretory protein SVP-1/-3/-4 gene, complete cds	0.14
2432	AK023305	Homo sapiens cDNA FLJ13243 fis, clone OVARC1000622	0.002
2433	AB048868	Macaca fascicularis brain cDNA, clone:QnpA-10055	0.044
2434	AF167585	Homo sapiens clone C13 immunoglobulin heavy chain variable region gene, partial cds	0.13
2435	AB013796	Ceratopteris richardii mRNA for CRHB6, complete cds	0.024

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE

2520	Y13870	Homo sapiens mRNA containing (CAG) ₆ repeat, clone CZ-CAG-12	0.06
2521	AF051769	Homo sapiens hyaluronidase-like pseudogene 1 (HYALP1), partial sequence	0.009
2522	AF309947	Dictyostelium discoideum Rac1A (rac1A) gene, complete cds; and unknown gene	0.77
2523	AF128392	Arabidopsis thaliana BAC F15P23	0.22
2524	AK020739	Mus musculus adult male spinal cord cDNA, RIKEN full-length enriched library, clone:A330106L17, full insert sequence	7.2
2525	Y09472	B.taurus gene encoding preprododecapeptide	0.24
2526	D87922	Rat DNA for 3'UTR of skeletal muscle sodium channel, partial sequence	0.4
2527	U70865	Carassius auratus CCK8 precursor, mRNA, complete cds	0.67
2528	AB012624	Homo sapiens FLI1 gene for ERGB transcription factor, intron 4 and partial cds	0.054
2529	AF180492	Crocota crocota microsatellite Ccr12 sequence	0.083
2530	AL078640	Human DNA sequence from clone 536P6 on chromosome 22. Contains an EST, complete sequence [Homo sapiens]	2E-11
2531	Z63184	H.sapiens CpG island DNA genomic MseI fragment, clone 7a1, forward read cpg7a1.ft1d	6E-22
2532	AL162055	Homo sapiens mRNA; cDNA DKFZp761M2223 (from clone DKFZp761M2223)	0.022
2533	AE001392	Plasmodium falciparum chromosome 2, section 29 of 73 of the complete sequence	6.5
2535	AF202903	Sporopachydermia cereana var. D77-321B internal transcribed spacer 1, 5.8S ribosomal RNA gene and internal transcribed spacer 2, complete sequence; and large subunit ribosomal RNA gene, partial sequence	0.14
2536	U59487	Borrelia burgdorferi P35 antigen protein gene, and 7.5 kDa lipoprotein gene, complete cds	0.029
2537	XM_030999	Homo sapiens KIAA0444 protein (KIAA0444), mRNA	0.012
2538	AF302838	Mus musculus putative tumor suppressor LEU2 gene, exons 1 and 2	0.63
2539	AF125423	Bresiliidae gen. sp. LSP21-1 cytochrome oxidase I gene, partial cds; mitochondrial gene for mitochondrial product	0.66
2540	AP001348	Homo sapiens genomic DNA, chromosome 21q21.1-q21.2 clone:f39G8, LL56-APP region, complete sequence	0.42

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
2541	XM_028324	Homo sapiens hypothetical protein FLJ14195; KIAA1714 protein (FLJ14195), mRNA	8E-98
2542	AF238860	Streptococcus mutans mutacin I biosynthesis gene cluster, partial sequence	4.6
2543	AE005391	Escherichia coli O157:H7 EDL933 genome, contig 3 of 3, section 10 of 290	1.6
2544	AK024518	Homo sapiens cDNA: FLJ20865 fis, clone ADKA01850	0.06
2545	AK026595	Homo sapiens cDNA: FLJ22942 fis, clone KAT08170, highly similar to HUMMHBW62 Homo sapiens (clone pMF18) MHC class I HLA-Bw62 mRNA	4E-39
2546	AL449163	Human DNA sequence from clone RP11-533E16 on chromosome 6, complete sequence [Homo sapiens]	2.3
2547	AJ305053	Caprine arthritis-encephalitis virus proviral partial pol gene for Pol protein (reverse transcriptase), isolate CAEV Br/UFRGS-2/C767	0.69
2548	AF283067	Homo sapiens clone 3ptel_c11bt3 sequence	1E-41
2549	AF286431	Bychovskiata intermedia from host Charadrius leschenaulti 16S ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.94
2550	L35232	Schizosaccharomyces pombe deoxyribonuclease (exo2) gene, exons 1-3, complete cds	0.93
2551	AF319044	Methanosarcina acetivorans strain C2A MtaF (mtaF) and MtaG (mtaG) genes, complete cds	0.034
2552	XM_018334	Homo sapiens hypothetical protein FLJ22418 (FLJ22418), mRNA	0.013
2553	U35862	Visna virus clone 678 env3.2 envelope polyprotein (env) gene, partial cds	0.17
2554	M20005	N.crassa conidation-specific protein genes con-10 (complete cds.) and con-13 (3' flank)	0.079
2555	AB050531	Macaca fascicularis brain cDNA, clone:QnpA-20907	1.4
2556	AB009693	Mus musculus gene for mafG, complete cds	5.6
2557	U67593	Methanococcus jannaschii section 135 of 150 of the complete genome	0.024
2558	XM_028292	Homo sapiens x 009 protein (MDS009), mRNA	4
2559	U67578	Methanococcus jannaschii section 120 of 150 of the complete genome	1.8
2560	AE001759	Thermotoga maritima section 71 of 136 of the complete genome	1.9
2561	AF363230	Phascolion strombi homeodomain transcription factor Gsx (Gsx) gene, partial cds	0.59
2562	NM_019211	Rattus norvegicus RAS guanyl releasing protein 1 (Rasgrp), mRNA	2.5
2563	U60070	Solanum tuberosum disease resistance homolog (St121) gene, partial cds	0.68
2564	AE006593	Streptococcus pyogenes M1 GAS strain SF370, section 122 of 167 of the complete genome	0.062

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
2565	AF147231	Wilkesia gymnoxiphium ASAPETALA1-A (ASAP1-A) gene, exons 3 through 8, partial cds	0.026

SEQ ID NO	ACCESSN	DESCRIP	P VALUE
3089	U29468	Drosophila koepferae KO4 San Luis, Argentina, Gandalf transposable element DNA< partial sequence	0.2
3090	AF279292	Mycoplasma hyopneumoniae strain ISU 232 YX1 (yx1) gene, partial cds; p110 membrane protein precursor, gene, complete cds; and YX2 (yx2) gene, partial cds	0.2
3091	AF391284	Homo sapiens 11p15.5 clone LOH11A, partial sequence	0.007
3092	AF259737	Ovis aries microsatellite MNS-64 sequence	0.66
3093	NM_030261	Mus musculus hypothetical protein MGC7182 (MGC7182), mRNA	6E-36
3094	AB047879	Macaca fascicularis brain cDNA, clone:QnpA-14270	0.00003
3095	X65607	H.sapiens MT1X gene for metallothionein 1X	0.023
3096	AF231164	Pseudosymblepharis schimperiana tRNA-Leu, partial sequence; trnL-trnF intergenic spacer, complete sequence; and tRNA-Phe, partial sequence; chloroplast genes for chloroplast products	0.06
3097	AF290431	Mus musculus sequence downstream of Hyal1; and Fus2 gene, 5' UTR and exon 1	1.3
3098	X96762	C.elegans mRNA for DNA topoisomerase I	0.028
3099	AB036229	Salganea nigrita mitochondrial COII gene for cytochrome oxidase II, partial cds, collection_site:Lake Danao, Leyte, Philippines	0.53
3100	AJ309183	Staphylococcus aureus partial coa gene for coagulase, type F, isolate rs59	0.07
3101	AF240785	Homo sapiens glutathione-S-transferase GSTT1 deletion/junction region sequence	0.000004
3102	XM_031737	Homo sapiens synaptosomal-associated protein, 23kD (SNAP23), mRNA	0.0000004
3103	AY035097	Arabidopsis thaliana putative proline-rich protein (F23H24.15) mRNA, complete cds	0.18
3104	AF121069	Anopheles farauti 3 12S small subunit ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.065
3105	NM_016701	Mus musculus nestin (Nes), mRNA	0.23
3106	L41893	Homo sapiens retinoblastoma susceptibility protein (RB1) gene, exon 5, bases 44452-44939 in L11910	0.008
3107	Z78623	H.sapiens flow-sorted chromosome 6 TaqI fragment, SC6pA12B7	2E-21
3108	XM_041367	Homo sapiens NADH dehydrogenase (ubiquinone) 1 beta subcomplex, 4 (15kD, B15) (NDUFB4), mRNA	2E-24
3109	AL117617	Homo sapiens mRNA; cDNA DKFZp564H0764 (from clone DKFZp564H0764)	0.17
3110	AK023907	Homo sapiens cDNA FLJ13845 fis, clone THYRO1000815	7E-42
3111	M95396	Yeast putative transcriptional activator (ADA2) gene, complete cds	3.8
3112	NC_002670	Bacteriophage bIL311, complete genome	0.073
3113	XM_037870	Homo sapiens desmoplakin (DPI, DPII) (DSP), mRNA	2.2
3114	NM_032276	Homo sapiens hypothetical protein DKFZp547E052 (DKFZp547E052), mRNA	0.43

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
3115	AB048877	Macaca fascicularis brain cDNA, clone:QnpA-16414	3E-30
3116	AK014209	Mus musculus 13 days embryo head cDNA, RIKEN full-length enriched library, clone:3110053B16, full insert sequence	0.029
3117	XM_037053	Homo sapiens rhabdoid tumor deletion region protein 1 (RTDR1), mRNA	9E-47
3118	AF156197	Cinara pseudotaxifolia cytochrome oxidase II gene, partial cds; mitochondrial gene for mitochondrial product	0.18
3119	AK022006	Homo sapiens cDNA FLJ11944 fis, clone HEMBB1000684	0.003
3120	U23175	Caenorhabditis elegans cosmid F57F10, complete sequence	0.022
3121	AF267198	Candidatus Carsonella ruddii natural-host Arytaina genistae ATP synthase alpha subunit (atpA) gene, partial cds; ATP synthase gamma subunit (atpG) gene, complete cds; and ATP synthase beta subunit (atpD) gene, partial cds	0.019
3122	AY026461	Homo sapiens CUB domain containing protein 1 (CDCP1) mRNA, complete cds	0.5
3123	NC_002471	Typhlonectes natans mitochondrion, complete genome	0.45
3125	AF328531	Homo sapiens clone 9qtel_c10t7 sequence	0.00001
3126	AF397158	Homo sapiens clone 11 pur alpha-associated ribosomal RNA gene, partial sequence	2E-37
3127	AF110970	HIV-1 isolate C-96BW11.06 country Botswana, complete genome	5.3
3128	AJ237690	Canis familiaris polymorphic marker clone XC08	1.3
3129	AE001176	Borrelia burgdorferi (section 62 of 70) of the complete genome	0.084
3130	AJ271333	Campylobacter hyoilei ORF1, ORF2, ORF3 and ORF4	6.7
3131	AF112247	Merluccius productus Mpro-1 mitochondrial control region, partial sequence	0.0008
3132	XM_002378	Homo sapiens uncharacterized hypothalamus protein HT010 (HT010), mRNA	4E-28
3133	AJ242726	Xenopus laevis mRNA for p21 activated kinase 2 (PAK2 gene)	0.25
3134	AF049711	Petunia x hybrida pollen-specific 1-aminocyclopropane-1-carboxylate synthase (ACS2) gene, complete cds	0.24
3135	XM_003091	Homo sapiens KIAA0001 gene product; putative G-protein-coupled receptor; G protein coupled receptor for UDP-glucose (KIAA0001), mRNA	2.2
3136	Z33368	M.capricolum DNA for CONTIG MCABF	0.001
3137	AE001433	Plasmodium falciparum chromosome 2, section 70 of 73 of the complete sequence	0.001
3138	AK017235	Mus musculus adult male pituitary gland cDNA, RIKEN full-length enriched library, clone:5330405D10, full insert sequence	0.7
3139	Z57308	H.sapiens CpG island DNA genomic MseI fragment, clone 170g9, reverse read cpg170g9.r1a	0.023
3140	AC005485	Homo sapiens PAC clone RP5-998M2 from 7q33-q35, complete sequence	5.4
3141	AF118654	Leishmania donovani ATPase 6 gene; kinetoplast gene for kinetoplast product	0.66

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
3142	AJ271879	Uncultured eubacterium plasmid pIE1130 DNA for repA gene, repC gene, repB gene, mobA gene, mobB gene, mobC gene, cac gene, catIII gene, sulII gene, strA gene, strB gene and aph(3')-I gene	0.26
3143	Y00165	Sus scrofa mRNA for link protein	0.079
3144	AF283982	Caenorhabditis elegans transcription enhancer factor-1-like protein EGL-44 (egl-44) gene, complete cds	0.0007
3145	AE004926	Pseudomonas aeruginosa PA01, section 487 of 529 of the complete genome	0.44

3458	Y16090	Daucus carota Susy*Dc1 gene	0.13
3459	AE003868	Xylella fastidiosa 9a5c, section 14 of 229 of the complete genome	0.16
3460	AF281912	Homo sapiens clone 16qtel_c89bt7 sequence	5E-36
3461	AF126541	Ateline herpesvirus 3 H-DNA terminal repeat unit, complete sequence	0.023
3462	AK011178	Mus musculus 10 days embryo cDNA, RIKEN full-length enriched library, clone:2600010E01, full insert sequence	1.5
3463	AF370226	Arabidopsis thaliana unknown protein (F1B16.11) mRNA, complete cds	0.4
3464	X94768	H.sapiens RP3 gene (XLRP gene 3)	0.21
3465	AB029068	Mus musculus gene for Ser/Thr kinase KKIAMRE, exon 1, 2, 3, 4, 5	0.57

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
3466	X84742	M.musculus GPX3 gene	0.038
3467	BC010011	Homo sapiens, Similar to RIKEN cDNA 4931428D14 gene, clone MGC:15407 IMAGE:4309613, mRNA, complete cds	0.22
3468	AF288536	Legionella longbeachae spectinomycin 3' adenyltransferase (aadA), possible transcriptional regulatory protein (lrpR), and possible sensor kinase protein (lskS) genes, complete cds; and unknown genes	1
3469	AF288536	Legionella longbeachae spectinomycin 3' adenyltransferase (aadA), possible transcriptional regulatory protein (lrpR), and possible sensor kinase protein (lskS) genes, complete cds; and unknown genes	1.8
3470	AB013150	Papilio machaon mitochondrial ND5 gene for NADH dehydrogenase subunit 5, partial cds	5.9
3471	XM_028011	Homo sapiens CGI-145 protein (LOC51028), mRNA	0.63
3472	XM_052069	Homo sapiens actin related protein (MGC15664), mRNA	5.7
3473	AL449163	Human DNA sequence from clone RP11-533E16 on chromosome 6, complete sequence [Homo sapiens]	0.00001
3474	X96685	B.burgdorferi cell division genes	1.9
3475	AF179589	Rana tigrina rugulosa glucagon receptor (GluR) mRNA, complete cds	0.19
3476	AJ297549	Homo sapiens partial PIK3CB gene for phosphatidylinositol 3-kinase catalytic subunit p110beta, exons 1-2 and joined CDS	0.87
3477	XM_032707	Homo sapiens KIAA0630 protein (KIAA0630), mRNA	0.2
3478	U25032	Caenorhabditis elegans par-3 mRNA, complete cds	1.3
3479	U89283	Biomphalaria glabrata myoglobin gene, complete cds	3.2
3480	AY029303	Strongylocentrotus purpuratus ADAM precursor, mRNA, complete cds	5.6
3481	AB043223	Mus musculus V186.2 gene for immunoglobulin heavy chain, clone:L1G6001	7.5
3482	AF304130	Danio rerio transmembrane receptor Roundabout1 (robo1) mRNA, complete cds	1.8
3483	AF386077	Homo sapiens interleukin 17B (IL17B) gene, complete cds	0.65
3484	U39889	Bos taurus Y-chromosome specific genomic sequence	0.65
3485	XM_032347	Homo sapiens region containing TLS-associated serine-arginine protein 1; TLS-associated serine-arginine protein 2; TLS-associated serine-arginine protein 2; TLS-associated serine-arginine protein 2; TLS-associated serine-arginine protein 1; TLS-associa>	0
3486	AF120475	Mus musculus myelin-associated oligodendrocytic basic proteins MOBP170 and MOBP69 (Mobp) gene, exons 3 through 5 and complete cds, alternatively spliced	0.0008
3487	U81676	Unidentified eubacterium clone vadinBC27 16S ribosomal RNA gene, partial sequence	0.31
3488	AL596023	Human DNA sequence from clone RP11-142J18 on chromosome X, complete sequence [Homo sapiens]	0.016
3489	U67210	Human clone HS2.16 Alu-Ya5 sequence	0.056

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
3490	XM_007196	Homo sapiens similar to ret finger protein 2; candidate tumor suppressor involved in B-CLL (H. sapiens) (LOC93519), mRNA	0.0000008
3491	AL049568	Human DNA sequence from clone SC22CB-23F1 on chromosome 22q13.31-13.33 Contains a GSS, complete sequence [Homo sapiens]	0.074
3492	X94755	A.thaliana mRNA for SNF1-related ser/thr protein kinase (1852 bp)	0.15
3493	AL392109	Human DNA sequence from clone RP13-459H7 on chromosome 10, complete sequence [Homo sapiens]	1.8
3494	S53497	immunoglobulin epsilon chain constant region=secreted form {3' region} [human, B cell myeloma U-266, Genomic, 3198 nt]	3.2
3495	X16027	R.norvegicus gene encoding alkaline phosphatase, exon 2	0.0009
3496	AF213918	Buchnera aphidicola plasmid pTrpEG isolate Mor26ps anthranilate synthase component I (trpE) pseudogene, partial sequence	0.004
3497	AE006491	Streptococcus pyogenes M1 GAS strain SF370, section 20 of 167 of the complete genome	0.33
3498	Z73587	S.cerevisiae chromosome XVI reading frame ORF YPL231w	0.089
3499	AK023040	Homo sapiens cDNA FLJ12978 fis, clone NT2RP2006321	2E-62
3500	AF062039	Homo sapiens integrin alpha-2 subunit (ITGA2) gene, ITGA2-1 allele, partial cds	0.65
3501	Z77974	H.sapiens flow-sorted chromosome 6 HindIII fragment, SC6pA5D12	0.036
3502	M13934	Human ribosomal protein S14 gene, complete cds	0.54
3503	NM_023220	Mus musculus RIKEN cDNA 2010106G01 gene (2010106G01Rik), mRNA	1.1
3504	AF140513	Homo sapiens clone 254LL2 genomic sequence	0.0004
3505	AL359558	Homo sapiens mRNA; cDNA DKFZp762O1615 (from clone DKFZp762O1615)	0.019
3506	XM_048768	Homo sapiens tetratricopeptide repeat domain 3 (TTC3), mRNA	0.00009
3507	AF074994	Homo sapiens full length insert cDNA YH91C06	0.65
3508	NC_001338	Sulfolobus virus 1, complete genome	0.008
3509	U67502	Methanococcus jannaschii section 44 of 150 of the complete genome	0.21
3510	AY035821	Schizosaccharomyces pombe Byr1-binding protein Bob1 (bob1) gene, complete cds	0.19
3511	AF275842	Plasmodium falciparum clone b.2 PfEMP1 (var) mRNA, partial cds	2
3512	AJ294714	Pichia anomala leu2 gene for beta-isopropylmalate dehydrogenase	0.19
3513	AL391240	Human DNA sequence from clone RP3-397P18 on chromosome 6, complete sequence [Homo sapiens]	3.4
3514	AE002304	Chlamydia muridarum, section 35 of 85 of the complete genome	1.8
3515	AF083830	Homo sapiens dihydropyridine receptor alpha 2 subunit (CACNA2D1) gene, exon 14	0.2

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
3516	AE005222	Escherichia coli O157:H7 EDL933 genome, contig 1 of 3, section 46 of 155	1.7
3517	U04208	Escherichia coli 9142-88 cytolethal distending toxin (cdtA, cdtB, and cdtC) genes, complete cds	0.008
3518	Y07738	M.musculus gene for vimentin	0.65
3519	AF304091	Sotalia fluviatilis alpha lactalbumin gene, partial cds	2
3520	AF270356	Staphylococcus epidermidis strain SR1 clone step.4025c09 genomic sequence	0.52
3521	AF017516	Bombus pascuorum cytochrome b (cytb) gene, mitochondrial gene encoding mitochondrial protein, partial cds	1.8
3523	AF098919	Gallus gallus alpha-globin gene domain 5' region	2
3524	XM_047517	Homo sapiens Kruppel-like factor 4 (gut) (KLF4), mRNA	1E-39
3525	NC_001626	Petromyzon marinus mitochondrion, complete genome	0.021
3526	AF246647	Bemisia tabaci biotype Q 16S ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	1.9
3527	AL391240	Human DNA sequence from clone RP3-397P18 on chromosome 6, complete sequence [Homo sapiens]	3.1
3528	M32779	AcNPV with an S.frugiperda insertion element IFP2.2	1.9
3529	L44121	Homo sapiens (clone pHK2.1D) CMT1A gene, repeat unit	6E-44
3530	U52350	Arabidopsis thaliana GTP-binding protein (ARAC5) mRNA, complete cds	0.007
3531	X80908	L.esculentum gene for fruit ripening polygalacturonase	0.65
3532	AF267203	Candidatus Carsonella ruddii natural-host Blastopsylla occidentalis ATP synthase alpha subunit (atpA) gene, partial cds; ATP synthase gamma subunit (atpG) gene, complete cds; and ATP synthase beta subunit (atpD) gene, partial cds	0.22
3533	AE001379	Plasmodium falciparum chromosome 2, section 16 of 73 of the complete sequence	0.25
3534	XM_034129	Homo sapiens hypothetical protein DKFZp761J1523 (DKFZp761J1523), mRNA	6
3535	AE002304	Chlamydia muridarum, section 35 of 85 of the complete genome	1.8
3536	AK024082	Homo sapiens cDNA FLJ14020 fis, clone HEMBA1002508	1.7
3537	U67547	Methanococcus jannaschii section 89 of 150 of the complete genome	0.22
3538	AF215629	Crypteronia paniculata chloroplast rpl16 gene, intron sequence	0.024
3539	X03853	Pea chloroplast gene for ribulose 1,5-bisphosphate carboxylase (rbcL)	0.008
3540	X85055	B.taurus cosmid-derived microsatellite DNA (clone IDVGA-40)	0.0009
3541	AK005508	Mus musculus adult female placenta cDNA, RIKEN full-length enriched library, clone:1600021C16, full insert sequence	0.63
3542	Y16262	Daucus carota mRNA for neutral invertase	0.21
3543	AL513491	Human DNA sequence from clone RP11-79A21 on chromosome X, complete sequence [Homo sapiens]	0.56
3544	XM_036298	Homo sapiens hypothetical gene supported by AL442095 (LOC91124), mRNA	0.02
3545	XM_049045	Homo sapiens KIAA0118 protein (KIAA0118), mRNA	0.46

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
3546	AY020760	Oryza sativa microsatellite MRG3085 containing (TA) _{X13} , closest to marker R2976, genomic sequence	5.4
3547	AF198037	Mycoplasma pulmonis LipB (lipB) gene, complete cds; and VsaG (vsaG) and VsaE (vsaE) genes, partial cds	0.008
3548	X62658	E.faecalis plasmid pAD1 seal gene and orf	1.7
3549	AF083468	Emericella nidulans putative zinc finger protein (flbC) gene, complete cds	0.18
3550	AF315801	Homo sapiens chromosome Y AHCP pseudogene, complete sequence	1.9
3551	AC007042	Homo sapiens clone RP11-399H17, complete sequence	6
3552	AF198037	Mycoplasma pulmonis LipB (lipB) gene, complete cds; and VsaG (vsaG) and VsaE (vsaE) genes, partial cds	0.008
3553	AK025090	Homo sapiens cDNA: FLJ21437 fis, clone COL04285	0
3554	X76027	K.lactis APA2 gene for tetraphosphatase, QCR7 gene, bcl complex subunit VII	0.4
3555	Z78713	H.sapiens flow-sorted chromosome 6 HindIII fragment, SC6pA15A11	0.61
3556	U50357	Streptococcus zooepidemicus zoocin A immunity factor (zif) and zoocin A endopeptidase (zooA) genes, complete cds	0.13
3557	U93721	Homo sapiens green cone photoreceptor pigment gene, 5' flanking region	1.4
3558	AJ291489	Paracentrotus lividus mRNA for fibrosurfin (surfin2656 gene)	3.7
3559	M13820	Plasmid Collb-p9 colicin Ib structural and immunity genes, complete cds	0.2
3560	Z54147	Human DNA sequence from cosmid L129H7, Huntington's Disease Region, chromosome 4p16.3 contains CpG island	2
3561	AJ301616	Homo sapiens DNC gene for deoxynucleotide carrier, exons 1-9	0.17
3562	U29403	Human immunodeficiency virus type 1 defective gag gene, clone 3-13, truncated cds	0.63
3563	AF090118	Plasmodium falciparum heat shock protein hsp104 (hsp104) gene, partial cds	0.21
3564	Z22707	S.scrofa spl IFN gene	0.57
3565	AF090889	Homo sapiens clone HQ0092	0.62
3566	XM_050705	Homo sapiens GalNAc-4-sulfotransferase 2 (GALNAC4ST-2), mRNA	0.15
3567	XM_016611	Homo sapiens similar to 8-oxoguanine DNA glycosylase (H. sapiens) (LOC93577), mRNA	0.052
3568	Z35914	S.cerevisiae chromosome II reading frame ORF YBR045c	0.59
3569	S69278	CYP1A2=3-methylcholanthrene responsive gene [Oncorhynchus mykiss=rainbow trout, liver, Genomic, 5023 nt]	1.5
3570	X56832	H.sapiens ENO3 gene for muscle specific enolase	0.21
3571	XM_011264	Homo sapiens KIAA0372 gene product (KIAA0372), mRNA	0
3572	NM_022628	Rattus norvegicus nephrin (Nphs1), mRNA	0.017
3573	AJ299718	Homo sapiens partial MASP2 gene, intron 7	6E-33
3574	Z69651	Human DNA sequence from cosmid L75B9, Huntington's Disease Region, chromosome 4p16.3	0.022

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
3575	AF327739	<i>Streptococcus thermophilus</i> Peb1 (peb1), GlnQ (glnQ), response regulator Rr1 (rr1), Hpk2 (hpk2), YycJ-like protein (yycJ), and MurM (murM) genes, complete cds	0.59
3576	AC001656	<i>Drosophila melanogaster</i> (P1 DS00397 (D18)) DNA sequence, complete sequence	0.068
3577	AF262620	<i>Periplaneta americana</i> 16S ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.2
3578	L08425	<i>Zea mays</i> auxin-binding protein (abp1) gene, exons 1-5 and complete cds	0.64
3579	M97702	<i>Drosophila melanogaster</i> glutathione S-transferase gene	1.8
3580	AF268059	Candidatus <i>Carsonella ruddii</i> natural-host <i>Arytaina geniotae</i> RNA polymerase beta subunit (rpoB) and RNA polymerase beta-prime subunit (rpoC) genes, partial cds	0.063

3845	AB062993	Macaca fascicularis brain cDNA clone:QmoA-10825, full insert sequence	4E-40
3846	AJ251485	Gorilla gorilla partial Imp7 gene for large multifunctional protease 7, exon 7 and tap2 gene for antigen peptide transporter 2, exons 1-6	0.71
3847	AP000145	Homo sapiens genomic DNA, chromosome 21q21.2, LL56-APP region, clone B2291C14-R44F3, segment 10/10, complete sequence	0.68
3848	XM_046052	Homo sapiens similar to ribosomal protein S3A (H. sapiens) (LOC65465), mRNA	0.017
3849	XM_012036	Homo sapiens potassium inwardly-rectifying channel, subfamily J, member 5 (KCNJ5), mRNA	5
3850	AB035883	Pseudoregma bambucicola mitochondrial genes for small subunit rRNA, tRNA-Val, large subunit rRNA, partial and complete sequences, country:Taiwan:Sun Moon Lake	0.077
3851	AB037688	Xenopus laevis Xptch-2 mRNA for patched-2, complete cds	1.8

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
3852	AB041264	Mus musculus pseudogene for GTP-binding protein beta1 subunit	0.53
3853	AF288170	Plasmodium falciparum isolate MM cytoadherence linked asexual protein (clag9) mRNA, partial cds	0.083
3854	AF304321	Neospora caninum RNA polymerase C1 (rpoC1) gene, partial sequence, plastid gene for plastid product	0.002
3855	AF133181	Peziza varia 18S ribosomal RNA gene, and internal transcribed spacer 1, partial sequence	2.1
3856	NM_012694	Rattus norvegicus Solute carrier family 6 (neurotransmitter transporter, dopamine), member 3 (Slc6a3), mRNA	0.56
3857	NM_030261	Mus musculus hypothetical protein MGC7182 (MGC7182), mRNA	6E-36
3858	AF231164	Pseudosymblepharis schimperiana tRNA-Leu, partial sequence; trnL-trnF intergenic spacer, complete sequence; and tRNA-Phe, partial sequence; chloroplast genes for chloroplast products	0.059
3859	Z36070	S.cerevisiae chromosome II reading frame ORF YBR201w	0.064
3860	Z24279	H. sapiens (D1S489) DNA segment containing (CA) repeat; clone AFM309ve9; single read	0.2
3861	XM_036937	Homo sapiens KIAA1020 protein (KIAA1020), mRNA	2.1
3862	AB033019	Homo sapiens mRNA for KIAA1193 protein, partial cds	1.6
3864	XM_030075	Homo sapiens hypothetical protein DKFZp434D0513 (DKFZp434D0513), mRNA	2E-74
3865	NM_023979	Rattus norvegicus apoptotic protease activating factor 1 (Apaf1), mRNA	0.59
3866	U50715	Mus musculus alpha-galactosidase A gene, complete cds	0.008
3867	AF078780	Caenorhabditis elegans cosmid C04F2	1.7
3869	L07305	Histoplasma capsulatum (clone pMS3) H-ATPase gene, complete cds	0.46
3870	XM_035796	Homo sapiens hypothetical gene supported by AF001893; AH005586 (LOC91063), mRNA	1.7
3871	NM_025788	Mus musculus RIKEN cDNA 4930511N13 gene (4930511N13Rik), mRNA	5.4
3872	AF339787	Homo sapiens clone IMAGE:205688, mRNA sequence	2
3873	AF028784	Rattus norvegicus glial fibrillary acidic proteins alpha and delta (GFAP) gene, alternatively spliced products, complete cds	0.005
3874	AF328904	Mus musculus lysyl-tRNA synthetase (Kars) gene, exon 14, complete cds; adenosine deaminase tRNA-specific 1 (Adat1) gene, exons EA, 1 and partial cds	0.22
3875	AF033647	Rhytidadelphus triquetrus 23S ribosomal RNA gene, partial sequence; internal transcribed spacer 2, 4.5S ribosomal RNA gene, internal transcribed spacer 3, and 5S ribosomal RNA gene, complete sequence, chloroplast genes for chloroplast RNAs	2
3876	BC006035	Mus musculus, clone IMAGE:3492938, mRNA, partial cds	5.6
3877	AF311856	Homo sapiens spectrin beta IV (SPTBN3) mRNA, complete cds, alternatively spliced	0.5
3878	AB041327	Anguilla japonica GnRH receptor mRNA for gonadotropin-releasing hormone receptor, complete cds	0.24

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
3879	AF220175	Homo sapiens acid ceramidase (ASAH) gene, exons 5 through 14, and complete cds	0.0009
3880	X89398	H.sapiens ung gene for uracil DNA-glycosylase	0.002
3881	L14017	Staphylococcus aureus methicillin-resistance protein (mecR) gene and unknown ORF, complete cds	0.56
3882	M97008	Xenopus laevis/gilli hybrid IgM chain gene, clone LG7Gmu	0.007
3883	Z78414	Caenorhabditis elegans cosmid W09D12, complete sequence	0.63
3884	AL512549	S.pombe chromosome I BAC pB2B4	1.9
3885	AB030616	Mus musculus Chetk-alpha gene for choline/ethanolamine kinase-alpha, exon 1 and 5'-flanking region	6.4
3886	AF069535	Bradypus tridactylus 16S ribosomal RNA gene, mitochondrial gene for mitochondrial RNA, complete sequence	1.5
3887	AK023304	Homo sapiens cDNA FLJ13242 fis, clone OVARC1000578	0.056
3888	AB039756	Brassica rapa SP11-32 mRNA for S locus protein 11-32, partial cds, strain:S32(50-11t)	1.9
3889	AL512405	Human DNA sequence from clone RP11-370N21 on chromosome 6, complete sequence [Homo sapiens]	1.6
3890	AF147813	Protrama radicis elongation factor 1 alpha gene, partial cds	0.18
3891	XM_046967	Homo sapiens region containing variable charge protein on X with eight repeats; variable charge protein on X with two repeats; variable charge, X chromosome (LOC92738), mRNA	0.21
3892	XM_037664	Homo sapiens hypothetical protein MGC4090 (MGC4090), mRNA	1.5
3893	AJ296142	Silene foetida partial rpb2 gene for RNA polymerase II, exons 23 and 24	0.16
3894	AF360340	Arabidopsis thaliana putative pectinesterase (K19E1.17/AT5g53370) mRNA, complete cds	2.7
3895	AF327975	Hentzia palmarum 16S ribosomal RNA, partial sequence; mitochondrial gene for mitochondrial product	0.55
3896	Z15140	L.esculentum mRNA for chitinase	2.1
3897	U57326	Chlamydomonas reinhardtii chloroplast complete Eco10 fragment, rpoC2 gene, partial cds	0.001
3898	AK024908	Homo sapiens cDNA: FLJ21255 fis, clone COL01321	0.003
3899	NC_002087	Plasmid pRL765, complete sequence	0.62
3900	AF063220	Papaya ringspot virus isolate P polyprotein gene, partial cds	0.25
3901	AE002173	Chlamydomonas pneumoniae AR39, section 9 of 94 of the complete genome	0.25
3902	BC001152	Homo sapiens, growth arrest-specific 7, clone MGC:1347 IMAGE:3353809, mRNA, complete cds	5.9
3903	AB011800	Agrobacterium tumefaciens plasmid pRiA4 gene, virB operon	5.4
3904	BC010389	Homo sapiens, clone MGC:13615 IMAGE:4283814, mRNA, complete cds	0.084
3905	AF091779	Oncorhynchus mykiss non-classical MHC class I antigen (Onmy-UAA) gene, Onmy-UAA*0101 allele, complete cds	2.3
3906	AF222716	Plasmodium falciparum clone 3D7 unconventional myosin PfM-B gene, complete cds	6.2

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
3907	Z48951	S.cerevisiae chromosome XVI cosmid 9723	2.5
3908	XM_040326	Homo sapiens absent in melanoma 1 (AIM1), mRNA	0.056

4801	AK024522	Homo sapiens cDNA: FLJ20869 fis, clone ADKA02377	0.21
4802	X62463	H.sapiens 3' flanking region for estrogen receptor (placenta) gene	0.7
4803	AE001127	Borrelia burgdorferi (section 13 of 70) of the complete genome	0.2
4804	Z70751	Caenorhabditis elegans cosmid F11A3, complete sequence	0.22
4805	XM_038231	Homo sapiens KIAA0793 gene product (KIAA0793), mRNA	6E-53
4806	AF223425	Mus musculus MAB21L2 (Mab21l2) gene, complete cds	4.5
4807	XM_039048	Homo sapiens hypothetical protein MGC11303 similar to Zink transporter 2 (MGC11303), mRNA	2
4808	U75604	Tilapia nilotica type I estrogen receptor mRNA, complete cds	0.057
4809	XM_015243	Homo sapiens stimulated trans-acting factor (50 kDa) (STAF50), mRNA	1.7
4810	AF247970	Caenorhabditis elegans cell cycle checkpoint protein Rad9 gene, complete cds	0.008
4811	X12574	Parsley PcPR1-2 mRNA for pathogenesis-related protein type A	0.077
4812	AF332562	Simian virus 40 strain 777, complete genome	0.64
4813	XM_005118	Homo sapiens general transcription factor IIE, polypeptide 2 (beta subunit, 34kD) (GTF2E2), mRNA	1
4814	BC006700	Mus musculus, Similar to RIKEN cDNA 2310035M22 gene, clone MGC:6680 IMAGE:3501285, mRNA, complete cds	0.21
4815	AB025319	Yaba monkey tumor virus DNA, BamH1 restriction fragment E, M and partial C, partial and complete cds	0.18
4816	XM_048433	Homo sapiens ATPase, H+ transporting, lysosomal (vacuolar proton pump), subunit 1 (ATP6S1), mRNA	0.55
4817	Y11095	Rice stripe virus RNA 3	5.9
4818	AL589991	Human DNA sequence from clone RP11-241J5 on chromosome 6, complete sequence [Homo sapiens]	3E-78
4819	XM_043498	Homo sapiens G protein-coupled receptor 44 (GPR44), mRNA	0.0002
4820	XM_047477	Homo sapiens KIAA1638 protein (KIAA1638), mRNA	0.077
4821	AJ242480	Streptococcus thermophilus ORF1, ORF2, ORF3, ORF4, ORF5 and ORF6 DNA, strain St0	0.18
4822	XM_016395	Homo sapiens region containing hypothetical protein; mutL (E. coli) homolog 3 (LOC82389), mRNA	6E-74
4823	XM_043492	Homo sapiens 42259 (KIAA1728), mRNA	0.0000006
4824	L43603	Gallus gallus Na+/K+-ATPase alpha-1 subunit gene, promoter region	0.41
4825	AF257746	Rattus norvegicus multidrug resistance protein 1a (Pgy1) mRNA, complete cds	0.5
4826	X68794	D.melanogaster "ten-a" mRNA for secreted protein	1.2

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
4827	AF330118	Homo sapiens voltage-gated sodium channel type III alpha subunit (SCN3A) gene, exon 2	0.12
4828	XM_011230	Homo sapiens ALL1 fused gene from 5q31 (AF5Q31), mRNA	5.8
4829	XM_030669	Homo sapiens hypothetical gene supported by AL133011 (LOC90288), mRNA	1.9
4830	U36927	Plasmodium yoelii rhoptry protein gene, complete cds	0.21
4831	AF201353	Columba livia glutamate receptor C gene, partial cds	5
4832	AF331435	HIV-1 D2 from Australia envelope protein (env) gene, partial cds	0.07
4833	AF362391	Candida albicans heat shock protein Hsp104 (HSP104) gene, HSP104-b allele, complete cds	1.1
4834	XM_027927	Homo sapiens hypothetical gene supported by Z97017 (LOC89989), mRNA	0.48
4835	AE001127	Borrelia burgdorferi (section 13 of 70) of the complete genome	0.72
4836	AL390126	S. pombe chromosome III cosmid c233	0.023
4837	AF110213	Rattus norvegicus insulin receptor precursor, exon 14	0.56
4838	M38534	Paramecium aurelia immobilization antigen (51C) gene, exon 5 and complete cds	0.015
4839	AE001430	Plasmodium falciparum chromosome 2, section 67 of 73 of the complete sequence	0.052
4840	AF181475	Mus musculus synaptonemal complex protein 3 (Sycp3) gene, exon 5	0.19
4841	AF177242	Bodo saltans clone pBME40 mitochondrial minicircle DNA	0.024
4842	XM_004347	Homo sapiens elongation of very long chain fatty acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 2 (ELOVL2), mRNA	0.66
4843	AF083494	Mus musculus phospholipase D1 (PLD1) gene, exons 23 and 24, complete sequence	0.53
4844	U89684	Lycopersicon esculentum protein kinase (LePK7) gene, partial cds	0.22
4845	AB025716	Staphylococcus aureus gene for FmtB, complete cds	0.57
4846	AF017180	Schizosaccharomyces pombe hexose transporter (Ght2) mRNA, complete cds	0.87
4847	Z26314	P.falciparum gene for STARP antigen	0.007
4848	XM_045160	Homo sapiens KIAA0275 gene product (KIAA0275), mRNA	1
4849	AK016495	Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4931431C02, full insert sequence	0.62
4850	BC004496	Homo sapiens, Similar to hypothetical protein FLJ14058, clone IMAGE:3831313, mRNA	1.7
4851	XM_005684	Homo sapiens tolloid-like 2 (TLL2), mRNA	1.6
4852	AF249077	Sphaerotheca pluvialis cytochrome b (cytb) gene, partial cds; mitochondrial gene for mitochondrial product	0.047
4853	XM_016934	Homo sapiens hypothetical protein FLJ12891 (FLJ12891), mRNA	5.4
4854	X65747	R.norvegicus gnat-3 mRNA for gustducin	0.2
4855	XM_011705	Homo sapiens paraneoplastic antigen MA2 (PNMA2), mRNA	0.2

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
4856	L10692	Arabidopsis thaliana cytosine-5 methyltransferase mRNA, complete cds	2.1
4857	AB052250	Arabidopsis thaliana gene for MYB transcription factor Atmyb2, complete cds, strain: Yo-0	0.36
4859	XM_033535	Homo sapiens region containing tryptase beta 2; tryptase beta 1 (LOC82314), mRNA	1.3
4860	U49846	Rattus norvegicus stem cell factor gene, 5' flanking region and exon 1, partial sequence	0.18
4861	AJ244021	Tetrahymena thermophila kin2 gene for kinesin-II homologue, exons 1-4	0.063
4862	AF201021	Stachyarrhena sp. Jansen-Jacobs 4707 ribosomal protein S16 (rps16) gene, partial intron sequence; chloroplast gene for chloroplast product	0.057
4863	AJ245636	Mus musculus P2Y1 gene for P2Y1 receptor	0.2
4864	AK023175	Homo sapiens cDNA FLJ13113 fis, clone NT2RP3002590	0.2

4994	M69146	Torulopsis glabrata metal-activated transcription factor (amt1) gene, complete cds	0.65
4995	AL121822	Human DNA sequence from clone 346P11 on chromosome Xq21.2-21.33, complete sequence [Homo sapiens]	5E-09
4996	AF072273	Lactuca sativa resistance protein candidate RGC2N (RGC2N) pseudogene, complete sequence	0.22
4997	AL358273	S.pombe chromosome II cosmid c29C10	0.22
4998	BC010011	Homo sapiens, Similar to RIKEN cDNA 4931428D14 gene, clone MGC:15407 IMAGE:4309613, mRNA, complete cds	0.22

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
4999	AF090889	Homo sapiens clone HQ0092	0.71
5000	M93140	Glycine max cv Prize protein kinase mRNA	2.1
5001	AE005266	Escherichia coli O157:H7 EDL933 genome, contig 1 of 3, section 90 of 155	1.8
5002	AE007350	Streptococcus pneumoniae section 33 of 194 of the complete genome	0.23
5003	BC008973	Homo sapiens, transmembrane protein with EGF-like and two follistatin-like domains 2, clone MGC:17007 IMAGE:4180709, mRNA, complete cds	0.023
5004	X13439	Cochliobolus heterostrophus mitochondrial gene for ATPase subunit 6	0.19
5005	AF138069	HIV-1 p5c028-h from USA envelope glycoprotein (env) gene, partial cds	2.1
5006	NM_002847	Homo sapiens protein tyrosine phosphatase, receptor type, N polypeptide 2 (PTPRN2), mRNA	6
5007	XM_036827	Homo sapiens hypothetical gene supported by X04201; X04588; AK026559; AY004867; BC000771; BC008407; BC008425 (LOC91191), mRNA	1
5008	NM_031389	Mus musculus ribonuclease/angiogenin inhibitor 2 (Rnh2), mRNA	1.7
5009	BC010355	Homo sapiens, Similar to nuclear protein, clone IMAGE:4248516, mRNA	5.4
5010	AE003909	Xylella fastidiosa 9a5c, section 55 of 229 of the complete genome	5.1
5011	NM_031389	Mus musculus ribonuclease/angiogenin inhibitor 2 (Rnh2), mRNA	1.7
5012	XM_016747	Homo sapiens latent transforming growth factor beta binding protein 1 (LTBP1), mRNA	2E-10
5013	M85304	Schistosoma mansoni homeodomain protein (smox-5) mRNA, complete cds	0.009
5014	NC_001398	Saccharomyces cerevisiae 2 micron circle plasmid, complete sequence	0.65
5015	AF267746	Drosophila melanogaster rad21 mitotic cohesin (drad21) gene, exons 3 through 8 and complete cds	0.003
5016	XM_052430	Homo sapiens E3 ubiquitin ligase SMURF1 (SMURF1), mRNA	2E-30
5017	X67813	C.familiaris SRP72 mRNA for signal recognition particle	0.16
5018	AF031848	Dermacentor marginatus 12S ribosomal RNA gene, mitochondrial gene for mitochondrial RNA, partial sequence	0.061
5019	XM_003317	Homo sapiens PDZ domain containing guanine nucleotide exchange factor(GEF)1 (PDZ-GEF1), mRNA	0.67
5020	XM_030673	Homo sapiens methyl-CpG binding domain protein 4 (MBD4), mRNA	0.6
5021	L38957	Saccharomyces cerevisiae nuclear-encoded mitochondrial isoleucyl-tRNA synthetase (ISM1) gene, complete cds	2.1
5022	AF345089	Hepatitis C virus isolate SCpreSC2c14 nonfunctional polyprotein gene, partial sequence	0.59

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
5023	AC091124	Caenorhabditis elegans cosmid Y47A7, complete sequence	1.7
5024	X66451	E.octocarinatus RPA2 gene for RNA polymerase I second largest subunit	0.066
5025	XM_010563	Homo sapiens hypothetical gene supported by AB033071; AB051480; AK000726; NM_015383 (LOC92396), mRNA	1E-15
5026	AF256722	Salmo salar clone BHMS458 microsatellite sequence	0.5
5027	AF385609	Homo sapiens minisatellite sequence	5.3
5028	AF355103	Pleurotus ostreatus linear mitochondrial plasmid mlp2, partial sequence	0.18
5029	XM_034863	Homo sapiens similar to hypothetical protein FLJ22294 (H. sapiens) (LOC90918), mRNA	1.8
5030	AF374005	Rattus norvegicus bradykinin B2 receptor gene, promoter sequence	8.3
5031	AK014447	Mus musculus 18 days pregnant adult female placenta and extra embryonic tissue cDNA, RIKEN full-length enriched library, clone:3830421F13, full insert sequence	0.18
5032	AL355577	Human DNA sequence from clone RP11-299G2 on chromosome 6 Contains a GSS, complete sequence [Homo sapiens]	0.0003
5033	AB030616	Mus musculus Chetk-alpha gene for choline/ethanolamine kinase-alpha, exon 1 and 5'-flanking region	6.1
5034	S66671	pol [simian Mason-Pfizer D-type retrovirus SM-PDT, systemic lupus erythematosus patient TFA 68, Genomic RNA, 113 nt]	0.008
5035	AB038481	Codium lucasii chloroplast rbcL gene for ribulose-1,5-bisphosphate carboxylase/oxygenase large subunit, partial cds	0.22
5036	U05013	Rattus norvegicus Sprague-Dawley heme oxygenase-2 non-reducing isoform gene, complete cds	1.9
5037	L81904	Homo sapiens (subclone 1_h7 from P1 H69) DNA sequence, complete sequence	1.7
5038	AF242384	Homo sapiens phytanoyl-CoA hydroxylase (PHYH) gene, exon 7	1.9
5039	X52863	G.max Gy4 gene for glycinin	5.9
5040	XM_002625	Homo sapiens ankyrin repeat and SOCS box-containing 3 (ASB3), mRNA	6
5041	U00789	Mus musculus Dp71 (DMD) gene, partial cds	0.068
5042	AB017429	Oryza sativa gene for mitochondrial ribosomal protein S14, succinate dehydrogenase iron-protein subunit (SDHB)	2
5043	U67518	Methanococcus jannaschii section 60 of 150 of the complete genome	0.002
5044	XM_048782	Homo sapiens c6.1A (C6.1A), mRNA	0.2
5045	AB055263	Macaca fascicularis brain cDNA, clone:QfIA-10674	0.003
5046	S65281	drebrin {clone eDcg5} [chickens, Genomic, 160 nt, segment 3 of 10]	0.61
5047	AF296203	Uncultured bacterium SY6-54 16S ribosomal RNA gene, partial sequence	0.25
5048	X06266	Anthirrhinum majus DNA for transposon tam2	0.007

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
5049	AF272387	Homo sapiens leucine zipper nuclear factor (BLZF1) gene, exon 6	7E-22

5179	AK018339	Mus musculus 10 days neonate cerebellum cDNA, RIKEN full-length enriched library, clone:6530414F19, full insert sequence	2.1
5180	XM_050838	Homo sapiens wingless-type MMTV integration site family, member 10A (WNT10A), mRNA	0.22
5181	AJ308588	Medicago truncatula partial mRNA for nodulin 25 (nod25 gene), clone 3	4.3

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
5182	AF229797	Homo sapiens cis-golgi SNARE (GOSR1) gene, exon 9 and partial cds	0
5185	Z68107	Caenorhabditis elegans cosmid F48C5, complete sequence	2.1
5186	AY026045	Mus musculus germ cell-specific unknown protein mRNA, complete cds	0.079
5187	AF309515	Staphylococcus aureus serine protease operon, complete sequence	1
5188	AF355103	Pleurotus ostreatus linear mitochondrial plasmid mlp2, partial sequence	0.069
5189	AF055079	Panulirus argus inositol 1,4,5-trisphosphate receptor (IP3R) mRNA, complete cds	5.2
5190	AC007184	Arabidopsis thaliana chromosome II section 163 of 255 of the complete sequence. Sequence from clones T11P11	6.1
5191	AB044348	Arabidopsis thaliana AtSUG1 mRNA, complete cds	1.2
5192	XM_003320	Homo sapiens hypothetical protein FLJ11155 (FLJ11155), mRNA	5.3
5193	AF148987	Legionella fallonii macrophage infectivity potentiator (mip) gene, partial cds	0.067
5194	X54200	Chicken mRNA for GARS-AIRS-GART	0.019
5195	AE005885	Caulobacter crescentus section 211 of 359 of the complete genome	0.62
5196	AF228498	Escherichia coli AgaR (agaR), KbaZ (kbaZ), AgaV (agaV), AgaW (agaW), AgaE (agaE), AgaF (agaF), AgaA (agaA), AgaS (agaS), KbaY (kbaY), AgaB (agaB), AgaC (agaC), AgaD (agaD), and AgaI (agaI) genes, complete cds	0.63
5197	U09859	Bos taurus enterokinase mRNA, complete cds	6.2
5198	AF057708	Populus balsamifera subsp. trichocarpa PTD protein (PTD) gene, complete cds	0.68
5199	AF238381	Homo sapiens PTOV1 (PTOV1) gene, complete cds	0.18
5200	AF119554	Plasmodium falciparum para-aminobenzoic acid synthetase gene, complete cds	0.13
5201	X82675	B.taurus BoLA-A11 gene (exon 6-8)	0.71
5202	AF303087	Tilapia mossambica glycoprotein alpha subunit mRNA, partial cds	0.64
5203	NM_006649	Homo sapiens serologically defined colon cancer antigen 16 (SDCCAG16), mRNA	1.7
5204	AF240597	Homo sapiens clone 7ptelc1117 sequence	e-112
5205	BC006702	Mus musculus, RIKEN cDNA 4930529O08 gene, clone MGC:7935 IMAGE:3583936, mRNA, complete cds	6.3
5206	AF295769	Mus musculus SMAD1 gene, intron 1, partial sequence	0.007
5207	AF118099	Toxoplasma gondii PITSLRE-like protein kinase (tpk1) gene, partial cds	1.9
5208	AF143952	Homo sapiens PELOTA (PELOTA) gene, complete cds	0.44
5209	AF028710	Influenza A virus (A/HongKong/156/97(H5N1)) nucleoprotein mRNA, complete cds	1.7
5210	XM_017097	Homo sapiens active BCR-related gene (ABR), mRNA	0.7

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
5211	M33312	Rat hepatic steroid hydroxylase IIA1 (CYP2A1) gene, complete cds	0.54
5212	L05616	Dictyostelium purpureum (Dpp4) DNA sequence, repeat region	0.061
5213	AE001425	Plasmodium falciparum chromosome 2, section 62 of 73 of the complete sequence	0.001
5214	XM_006574	Homo sapiens similar to plakophilin 2 (H. sapiens) (LOC93271), mRNA	0.009
5215	XM_011195	Homo sapiens centromere protein E (312kD) (CENPE), mRNA	0.002
5216	AF181881	Helicobacter pylori TolB (tolB) and PAL (excC) genes, complete cds	0.65
5217	U33208	Human B-lymphocyte activation antigen (B7.1) gene, enhancer region and 5' UTR	0.0003
5218	AB052187	Macaca fascicularis brain cDNA, clone:QnpA-12170	0.7
5219	AY032741	Drosophila melanogaster H.M.S. Beagle transposon long terminal repeat, complete sequence; and heat shock protein Hsp70Ab gene, promoter and partial cds	0.63
5220	AJ276592	Pisum sativum lip1 mutant cop1 gene for constitutively photomorphogenic 1 protein, exons 1-19	5.7
5221	XM_045136	Homo sapiens similar to cadherin related 23 (H. sapiens) (LOC92444), mRNA	2E-52
5222	AK014534	Mus musculus 0 day neonate skin cDNA, RIKEN full-length enriched library, clone:4631424J17, full insert sequence	2E-55
5223	U67572	Methanococcus jannaschii section 114 of 150 of the complete genome	0.65
5224	AK026607	Homo sapiens cDNA: FLJ22954 fis, clone KAT09813, highly similar to AF010315 Homo sapiens Pig11 (PIG11) mRNA	0.21
5225	Y08580	F.rubripes hsp70-3 gene, 3'UTR	1.8
5226	AL359819	Human DNA sequence from clone RP11-109B17 on chromosome 1, complete sequence [Homo sapiens]	0.76
5227	AF118099	Toxoplasma gondii PITSLRE-like protein kinase (tpk1) gene, partial cds	1.9
5228	U48937	Homo sapiens amiloride-sensitive epithelial sodium channel gamma subunit gene, promoter region and exon 1	5.1
5229	AK017057	Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4933434I20, full insert sequence	1.8
5230	AF044770	Phaeoprogne tapera microsatellite HrU6 allele 2 repeat region	4.6
5231	XM_012268	Homo sapiens amino acid transporter 2 (KIAA1382), mRNA	0.009
5232	BC008544	Mus musculus, Similar to hypothetical protein, clone MGC:7703 IMAGE:3497634, mRNA, complete cds	7E-22
5233	AB046353	Sapporo-like virus Yak2-2000-jp pol gene for RNA-dependent RNA polymerase, partial cds	6.2
5234	L07305	Histoplasma capsulatum (clone pMS3) H-ATPase gene, complete cds	0.65
5235	NM_012828	Rattus norvegicus Calcium channel subunit beta 3 (Cacnb3), mRNA	2
5236	AF277959	Helicobacter pylori strain 96-74 BabB (babB) gene, partial cds	0.71

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
5237	Z16681	H. sapiens (D8S266) DNA segment containing (CA) repeat; clone AFM151ye3; single read	0.003
5238	AB049452	Staphylococcus epidermidis composite transposon DNA, complete sequence	0.077
5239	X83673	X.laevis SSB1 gene	1.5
5240	XM_045182	Homo sapiens serine (or cysteine) proteinase inhibitor, clade F (alpha-2 antiplasmin, pigment epithelium derived factor), member 2 (SERPINF2), mRNA	6.2
5241	AF263074	Cobitis paludica cytochrome b gene, partial cds; mitochondrial gene for mitochondrial product	0.15
5242	XM_029785	Homo sapiens Kell blood group (KEL), mRNA	2.1
5243	AE006148	Pasteurella multocida PM70 section 115 of 204 of the complete genome	5.5
5244	X81975	B.vulgaris mRNA for sucrose 6-phosphate synthase	1.3
5245	NM_033105	Homo sapiens beta cysteine string protein (LOC85479), mRNA	0.000006
5246	AC006164	Homo sapiens clone UWGC:y28gap from 6p21, complete sequence	0.47
5247	AJ279971	Canis familiaris microsatellite DNA, clone DTRcn.20	0.022
5248	AE005618	Escherichia coli O157:H7 EDL933 genome, contig 3 of 3, section 237 of 290	0.56
5249	AJ012338	Listeria monocytogenes NotI restriction site number two and flanking sequences	1.6
5251	D14027	Mouse DNA for TL antigen, complete cds	5
5252	Y12285	H.armigera mRNA for putative serine protease, clone SR106	0.009
5253	AF281912	Homo sapiens clone 16qtel_c89bt7 sequence	1E-68
5254	NC_001790	Ovine papillomavirus 2, complete genome	0.61
5255	XM_031110	Homo sapiens kallikrein 10 (KLK10), mRNA	0.041
5256	XM_042732	Homo sapiens guanine nucleotide binding protein (G protein), alpha inhibiting activity polypeptide 3 (GNAI3), mRNA	0.42
5257	XM_033541	Homo sapiens KIAA0704 protein (ORP3), mRNA	0.022
5258	AL512432	Human DNA sequence from clone RP11-245H22 on chromosome 6 Contains GSSs, complete sequence [Homo sapiens]	0.0001
5259	S82508	Human adenovirus type 9 E4 protein (E4), Orf2, Orf3, Orf4, and Orf6 genes, complete cds; and Orf7 gene, partial cds	1.6
5260	XM_015579	Homo sapiens hypothetical protein FLJ13105 (FLJ13105), mRNA	1.2
5261	AF009177	Helicobacter pylori pfs protein homolog (pfs) and sigma 80 (rpoD) genes, complete cds	0.6
5262	AB015470	Arabidopsis thaliana genomic DNA, chromosome 5, TAC clone:K1B16	5.2
5264	L08970	Nematode choline acetyltransferase (cha-1) gene, exons 1-11 and complete cds	0.29
5265	D88193	Brassica rapa DNA for S-receptor kinase, complete cds	0.69
5266	XM_046294	Homo sapiens testis expressed sequence 15 (TEX15), mRNA	0.21
5267	XM_027078	Homo sapiens ATPase, Class V, type 10D (ATP10D), mRNA	0.22

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
5268	AK019309	Mus musculus adult male hippocampus cDNA, RIKEN full-length enriched library, clone:2900009I19, full insert sequence	2E-13
5269	NM_016985	Mus musculus myotubularin related protein 1 (Mtmr1), mRNA	0.0004
5270	AK020049	Mus musculus 13 days embryo male testis cDNA, RIKEN full-length enriched library, clone:6030408K18, full insert sequence	1.8
5271	AF323989	Danio rerio transcriptional intermediary factor 2 mRNA, complete cds	6.3
5272	AF175275	Pisum sativum trans-cinnamic acid hydroxylase (CYP73A9) gene, CYP73A9-v1 allele, partial cds	0.073
5274	AF327749	Mus musculus smoothelin gene, promoter and partial sequence	6E-11
5275	AJ276633	Glomus mosseae partial TOR2 gene, exons 1-9	6
5276	AF110612	Boophilus microplus cytochrome b apoenzyme (Cytb) gene, partial cds; tRNA-Ser, tRNA-Leu, tRNA-Cys, and tRNA-Met genes, complete sequence; and NADH dehydrogenase subunit 2 (ND2) gene, partial cds, mitochondrial genes for mitochondrial products	0.072
5278	XM_043395	Homo sapiens fatty acid desaturase 2 (FADS2), mRNA	3E-36
5279	XM_046528	Homo sapiens zinc finger protein 133 (clone pHZ-13) (ZNF133), mRNA	2
5280	U20807	Bos taurus protein tyrosine phosphatase BA14 mRNA, complete cds	0.19
5281	XM_036368	Homo sapiens hypothetical gene supported by AK026802 (LOC91132), mRNA	0.026
5282	XM_007023	Homo sapiens G protein-coupled receptor kinase-interactor 2 (GIT2), mRNA	7E-44
5283	U86362	Saccharomyces cerevisiae MAL gene divergent promoter region, and hypothetical protein, complete cds	0.24
5284	Y11740	H.sapiens whn gene, exon 1a and 1b	0.22
5285	S78915	{Mu1 element insertion site, clone 11} [maize, Transposon, 300 nt]	0.002
5286	AF310896	Dictyostelium discoideum RacJ (racJ) gene, complete cds; LagC-like protein (lagC3) gene, partial cds; and unknown genes	0.23
5287	AJ012333	Buchnera aphidicola plasmid pBTc2, trpE and trpG genes	0.027
5288	AF282046	Homo sapiens clone 15qtel_c321bt7 sequence	4E-30
5289	L25128	Lycopersicon esculentum auxin-induced proteinase inhibitor (ARPI) gene, complete cds	0.51

5557	L13966	Mouse delta/YY1/NF-E1/UCRBP transcription factor, exon 3	0.65
5558	AF172730	Streptococcus gordonii Sagg-like protein gene, complete cds; and Oct-like protein gene, partial cds	1.9
5559	AL591422	Human DNA sequence from clone RP11-124P3 on chromosome X, complete sequence [Homo sapiens]	1.8
5560	AF328433	Homo sapiens clone 2qtel_c275_24t3 sequence	4.8
5561	AF052640	Podarcis pityusensis cytochrome b (cytb) gene, mitochondrial gene encoding mitochondrial protein, partial cds	2.3
5562	AF133000	Cicindela marutha 16S large subunit ribosomal RNA, mitochondrial gene for mitochondrial product, complete sequence	0.024
5563	AJ239057	Antirrhinum majus far gene for farinelli protein	5.1
5564	AL032651	Caenorhabditis elegans cosmid Y6D1A, complete sequence	2
5565	AJ278974	Homo sapiens partial SNAP-23 gene for synaptosome associated protein-23, exons 6-8	1.8
5566	M33379	Guinea pig lipoprotein lipase (gplpl) gene, exon 3-7	0.46
5567	AF303443	Rheum reticulatum tRNA-Leu (trnL) gene and trnL-trnF intergenic spacer, partial sequence; chloroplast gene for chloroplast product	0.018
5568	L81826	Homo sapiens (subclone 1_g10 from P1 H39) DNA sequence, complete sequence	4E-16
5569	NM_005958	Homo sapiens melatonin receptor 1A (MTNR1A), mRNA	2
5570	AJ133356	Homo sapiens MSMB gene (partial), exons 2-3	0.66

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
5571	D86577	Human herpesvirus type 7 U38 gene, U39 gene for glycoprotein B and U40 gene for DNA polymerase, complete and partial cds	0.5
5572	AE006578	Streptococcus pyogenes M1 GAS strain SF370, section 107 of 167 of the complete genome	0.008
5573	U31170	Streptococcus mutans ATPase operon, complete sequence	0.041
5575	AF301004	Schistosoma mansoni thioredoxin peroxidase 3 (TPx3) gene, complete cds	0.23
5576	AF269295	Staphylococcus epidermidis strain SR1 clone step.1000d09 genomic sequence	2
5577	AF114934	Saccharomyces sp. S6U ATP synthase subunit 8 (ATP8) gene, mitochondrial gene encoding mitochondrial protein, complete cds	0.008
5578	AF261143	Homo sapiens chromosome 9 lung cancer-associated mRNA	2
5579	X95276	P.falciparum complete gene map of plastid-like DNA (IR-B)	0.00003
5580	NM_030844	Rattus norvegicus islet cell autoantigen 1, 69 kDa (Ica1), mRNA	0.63
5581	XM_001738	Homo sapiens proteoglycan 4, (megakaryocyte stimulating factor, articular superficial zone protein) (PRG4), mRNA	0.21
5582	AB060860	Macaca fascicularis brain cDNA clone:QtrA-11624, full insert sequence	5.1
5583	NC_001566	Apis mellifera ligustica mitochondrion, complete genome	0.15
5584	AF239566	Polycynis ornata tRNA-Leu (trnL) gene, partial sequence; and trnL-F intergenic spacer region, complete sequence; chloroplast gene for chloroplast product	0.008
5585	X92893	C.roseus GGPP synthase gene	1.6
5586	XM_002601	Homo sapiens desmin (DES), mRNA	5.7
5587	NM_012745	Rattus norvegicus CD94 antigen (located within the rat natural killer gene complex) (Klrd1), mRNA	1.4
5588	AK022035	Homo sapiens cDNA FLJ11973 fis, clone HEMBB1001221	0.023
5589	AB020595	Plasmodium falciparum 1-CysPxn mRNA for 1-cys peroxidoxin, complete cds	1.4
5590	AL121778	Human DNA sequence from clone RP5-839B11 on chromosome 20. Contains the first coding exon of the gene for a novel protein with a Kunitz/Bovine pancreatic trypsin inhibitor domain and WAP-type (Whey Acidic Protein) 'four-disulfide core' domains and an e>	0.07
5591	AF222338	Rattus norvegicus voltage gated N-type calcium channel alpha1B gene, partial cds, alternatively spliced	5.8
5592	AF247193	Mus musculus endobrevin (Vamp8) gene, exon 1	0.18
5593	AC026061	Homo sapiens BAC clone RP11-223K9 from Y, complete sequence	e-163
5594	XM_030132	Homo sapiens ubiquitin specific protease 9, X chromosome (Drosophila fat facets related) (USP9X), mRNA	0.21
5595	AK015052	Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4930402K13, full insert sequence	0.22
5596	AK023333	Homo sapiens cDNA FLJ13271 fis, clone OVARC1001000	0.002
5597	AB058702	Homo sapiens mRNA for KIAA1799 protein, partial cds	0.007
5598	Z36800	H.sapiens (xsl49) mRNA, 250bp	0.0003

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
5599	XM_044123	Homo sapiens cadherin 20, type 2 (CDH20), mRNA	4E-48
5600	XM_030272	Homo sapiens LOC88835 (LOC88835), mRNA	0.3
5601	AF030944	Brugia malayi microfilarial sheath protein SHP3a (Bmshp3a) and microfilarial sheath protein SHP3 precursor (Bmshp3) genes, complete cds	0.089
5602	U59882	Mus musculus MLH1 gene, exon 2	5.2
5603	AL591498	Human DNA sequence from clone RP11-113L12 on chromosome 13, complete sequence [Homo sapiens]	1.8
5604	AB002169	Rattus norvegicus RT1.P1 pseudogene for TL antigen	2
5605	AB009907	Luciola kuroiwae mitochondrial DNA for 16S rRNA, partial sequence	0.003
5606	AF336829	Rattus norvegicus NEDD8-activating enzyme mRNA, complete cds	0.58
5607	AJ310344	Scyllorhinus canicula partial mRNA for follicle stimulating hormone beta subunit (fsh beta gene)	0.22
5608	D00653	Homo sapiens gene for enteric smooth muscle gamma-actin, exon 8	2
5609	AF203972	Shuttle vector pBA complete sequence	2
5610	AK004804	Mus musculus adult male lung cDNA, RIKEN full-length enriched library, clone:1200016B11, full insert sequence	5.3
5611	AF270009	Staphylococcus epidermidis strain SR1 clone step.1040e03 genomic sequence	0.037
5612	BC006448	Homo sapiens, clone IMAGE:3637085, mRNA	1.9
5613	AF298202	Dictyostelium discoideum putative transposon DDT-B, complete sequence	0.019
5614	AF272001	Ebola virus subtype Zaire strain Mayinga complete genome	0.002
5615	M86544	Cow prostaglandin F synthetase II (PGFSII) mRNA, complete cds	0.075
5616	XM_039684	Homo sapiens putative G-protein coupled receptor (SH120), mRNA	0.16
5617	AJ299399	Medicago truncatula mRNA for putative AUX1-like permease (lax3 gene)	6.4
5618	L39214	Ovis aries glucose transporter type 3 (GLUT-3) mRNA, complete cds	0.23
5619	XM_010126	Homo sapiens stromal antigen 2 (STAG2), mRNA	e-127
5620	Z23801	H. sapiens (D17S931) DNA segment containing (CA) repeat; clone AFM248tg5; single read	5E-19
5621	AF210842	Homo sapiens HARP (HARP) gene, exon 17 and complete cds	0.65
5622	AB047239	Staphylococcus aureus DNA, complete structure of cassette chromosome(SCC)-like element, strain:ATCC25923	0.25
5623	AB035193	Homo sapiens RHCE gene, intron 7, complete sequence	2.1
5624	XM_045035	Homo sapiens hypothetical protein FLJ21343 (FLJ21343), mRNA	2.4
5625	XM_052223	Homo sapiens DKFZP564G092 protein (DKFZP564G092), mRNA	0.67
5626	Z28007	S.cerevisiae chromosome XI reading frame ORF YKL007w	0.23

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
5627	M14080	Herpesvirus saimiri thymidylate synthase gene, complete cds	0.025
5628	AF067218	Caenorhabditis elegans cosmid K10E9	0.071
5629	AK017102	Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4933437K13, full insert sequence	0.76
5630	XM_038524	Homo sapiens hypothetical protein FLJ23059 (FLJ23059), mRNA	e-118
5631	AB052773	Bombyx mori Bmdsx gene, exon 1, 2, 3, 4, female-specific splicing product complete cds	0.24
5632	AF233069	Galdieria sulphuraria maturase (matK) gene, partial cds; 50S ribosomal protein, ribulose-1,5-bisphosphate carboxylase/oxygenase large subunit (rbcL), ribulose-1,5-bisphosphate carboxylase/oxygenase small subunit (rbcS), acetohydroxy-acid synthase small>	0.55
5633	AK027218	Homo sapiens cDNA: FLJ23565 fis, clone LNG10846	0.24
5634	AF198462	HIV-1 isolate WM710-5 from Australia envelope glycoprotein (env) gene, partial cds	0.61
5636	AF213717	Euhadra quaesita haplotype Mana-B 16S ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.21
5637	AE002730	Drosophila melanogaster genomic scaffold 142000013385730, complete sequence	1.4
5638	AF110027	Candida albicans ATP-dependent transporter (YCF) gene, complete cds	0.069
5639	Z73978	Caenorhabditis elegans cosmid ZC302, complete sequence	0.21
5640	AF379877	Aclista sp. M226 16S ribosomal RNA gene, partial sequence; mitochondrial gene for mitochondrial product	0.52
5641	AF364544	Larix lyallii microsatellite LLY13 sequence	2.2
5642	AF346905	Dermatophagoides farinae allergen Def f II precursor, mRNA, partial cds	0.008
5643	AE001426	Plasmodium falciparum chromosome 2, section 63 of 73 of the complete sequence	0.001
5644	XM_002850	Homo sapiens TU3A protein (TU3A), mRNA	0.078
5645	AB032899	Rattus norvegicus PIPK2 alpha mRNA for phosphatidylinositol 5-phosphate 4-kinase alpha, complete cds	4.4
5646	AK017370	Mus musculus 6 days neonate head cDNA, RIKEN full-length enriched library, clone:5430431E21, full insert sequence	6E-64
5647	XM_042126	Homo sapiens similar to GTP-RHO BINDING PROTEIN 1 (RHOPHILIN) (M. musculus) (LOC91997), mRNA	3E-47
5648	XM_048666	Homo sapiens runt-related transcription factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1), mRNA	6.3
5649	AJ000259	Caenorhabditis elegans osm-6 mRNA	0.6
5650	AK017713	Mus musculus 8 days embryo cDNA, RIKEN full-length enriched library, clone:5730488L07, full insert sequence	0.087
5651	XM_010294	Homo sapiens arylsulfatase E (chondrodysplasia punctata 1) (ARSE), mRNA	8E-36
5652	XM_039942	Homo sapiens Meis (mouse) homolog 3 (MEIS3), mRNA	0.53

Table 3A Nearest Neighbor (BlastN vs. Genbank)			
SEQ ID NO	ACCESSN	DESCRIP	P VALUE
5653	AK019524	Mus musculus 0 day neonate head cDNA, RIKEN full-length enriched library, clone:4833439O17, full insert sequence	1.7
